TITLE: The effect of dihydroergotamine ^{44.5} on interoceptive metabolic reflexes at normal temperature and during hypothermia

SOURCE: AN AzerbSSR. Doklady, v. 21, no. 7, 1965, 72-75

TOPIC TAGS: hypothermia, dihydroergotamine, interoceptive reflex, unconditioned reflex, adrenals, cat, rabbit

ABSTRACT: The effect of dihydroergotamine on stimulated and cooled animals was investigated as part of a continuing study by the authors of carbohydrate metabolism during interoceptive stimulation in hypothermia. Dihydroergotamine, an adrenolytic substance, was chosen for comparison with the results of previous experiments using ephedrine, which has an opposite effect. Thirty-five anesthetized cats and 12 anesthetized rabbits were injected with dihydroergotamine (6 mg/kg of body weight). A special cooling chamber [not described] was used to induce hypothermia. Receptors of the rectum were stimulated by a pressure of 100 mm Hg for 1 min. In the first part of the experiment, the effect of dihydroergotamine on blood-sugar levels in normal and adrenalectomized animals was determined. It was found that dihydroergotamine caused a prolonged depression of the blood-sugar level in all experimental animals.

Card 1/3

L 10234-66

ACC NR: AP6000691

The fact that complete adrenalectomy does not alter the effect of dihydroergotamine on the blood-sugar level shows that it is not dependent on the adrenals. In the second part of the experiment, the effect of dihydroergotamine on interoceptive unconditioned reflexes was studied under normal temperature conditions and during hypothermia. Results of the experiment are shown in Fig. 1. Experimental data demon-

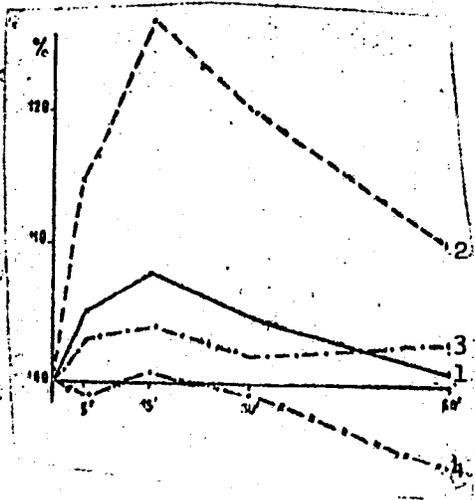

Fig. 1. Change in interoceptive unconditioned metabolic reflexes at normal temperature (1), after the injection of dihydroergotamine (2), during shallow hypothermia [28C] (3), and deep hypothermia [25C] (4) after the injection of dihydroergotamine

TITLE: Elastoplastic equilibrium and adaptability of a thick walled pipe subjected to internal pressure and temperature drop

SOURCE: AN AzerbSSR. Izvestiya. Seriya fiziko-tekhnicheskikh i matematicheskikh nauk, no. 4, 1965, 123-132

TOPIC TAGS: elastic material, elasticity theory, stress analysis

26

ABSTRACT: Polar-symmetric equilibrium of a pipe made of ideally elastoplastic material is analyzed in the general case in which the axial stress is not required to be the intermediate primary stress. The solution is completed for the case of plane deformation. The relations between the external and internal radii and the parameter of temperature drop are found, allowing the determination of the critical quantity at which the axial stress will not be the intermediate primary stress. The case is considered in which in a region near the inner surface of the pipe, a new plastic region is formed with stresses equal to the axial and peripheral stresses. The case of a statically undefinable stress distribution, when the intermediate primary stress is radial, is

Card 1/2

TITLE: Elastic-plastic equilibrium and adaptability of a hollow sphere with inner cladding in a temperature field

SOURCE: AN AzerbSSR. Izvestiya. Seriya fiziko-tekhnicheskikh i matematicheskikh nauk, no. 3, 1966, 34-41

TOPIC TAGS: thermal stress, elastic deformation, thermal strain hardening

ABSTRACT: The effects of a radial temperature drop on the stress distribution in a hollow sphere, consisting of two concentric, rigidly joined layers (a thick outer layer, and a thin inner cladding) of different perfectly elastic-plastic materials are examined. It is assumed that the temperature field in the sphere is symmetric, the temperature and stresses are uniformly distributed over the thickness of a layer, and that the thermal-expansion coefficient of the cladding is higher than that of the outer layer. The solution is performed in two versions: when the plastic flow of material starts either in the inner or in the outer layer. The strain hardening (called here "adaptability") of the materials of a layer in case of repeated loading (e.g. cyclic temperature variation) is also discussed. The mutual pressure p by which

Card 1/2

ACC NR: AP6036944

the layers act on each other is considered, and the problem is divided into two parts: 1) a hollow sphere with radii A and B is subjected to internal pressure p at temperature T_0 ; and 2) a hollow sphere of radius A and thickness t is subjected to external pressure p at temperature T_1 . The unknown pressure p is determined from the condition of identity and continuity of the radial displacements over the interface in both problems. The pressures p_0 and p_1 at which yielding of the (outer and inner, respectively) layer material begins are determined and discussed, and expressions describing the elastic-plastic states and radial displacements are derived for cases when $p_0 < p_1$ and $p_0 > p_1$. The rates of plastic deformation and bounds of plastic zones are determined. This phenomenon of "adaptability" is analyzed by introducing parameters which describe the system of residual stresses and the temperature field in the sphere during a cycle. An expression for determining the "adaptability temperature" is derived, and the formation of plastic zones when the maximum temperature of the cycle is higher than the "adaptability temperature" is explained. Orig. art. has: 3 figures and 37 formulas.

TITLE: Stratigraphy and Lithology of the Rocks in the
Northern Part of the Baku Archipelago (Middle Pliocene
to Quaternary) [Stratigrafiya i litologiya otlozheniy
severnoy chasti Bakinskogo arhipelaga (Chetvertichnyy
period--sredniy pliotsen)]

PERIODICAL: Tr. Azerb. industr. in-ta, 1955, Nr 10, pp 5-16

ABSTRACT: The picture of this section has been built up by data
from holes drilled both on the islands and in the sea
(from barges). The Quaternary deposits [Baku, Gyurgyarskiy,
and Khozarskiy yarusy (series)] fill synclinal downwarps
and cover terraces on the islands; they consist of
clays, with admixtures of silty and sandy particles.
The greatest thickness, 550 m to 600 m, occurs in the
synclinal downwarps. The Apsheron deposits are exposed
on the limbs of anticlinal uplifts. They are chiefly
