Action of prostigmine on paralysis following cerebral trauma  
American Review of Soviet Medicine, New York, 1947, 4/3 (201-205)

Prostigmine was injected one or more times in nearly 300 patients suffering from cerebral trauma with paralysis. In most cases there was immediate and lasting motor and sensory improvement. In some this was striking, and in only 6 per cent of cases was no improvement observed. The author concludes that prostigmine corrects functional asynapsis - the functional imitation of structurally intact nervous elements exposed to the toxic autolytic products of adjacent destroyed tissue. It is presumed that prostigmine exerts a direct beneficial effect on the altered enzymatic processes in these poisoned tissues, as well as an indirect effect via the vegetative nervous system.

"Neuropatol i Psikhiatr" Vol XX, No 2, pp 36, 37

Ticks of Byelovezhskaya Pushcha contain neuro-tropic virus which upon introduction into the brain of mice or sheep produces disease resembling Scotch encephalomyelitis. While humans in this area get that type disease, it does not affect sheep under natural conditions. It seems that Ixodes ricinus carries virus which produces

186TR82

USSR/Medicine - Virus Diseases Mar/Apr 51  
(Contd)

disease of the Scotch type, (meningoencephalitis), while infection from I. persulcatus results in classical type of tick encephalitis similar to that occurring in the Far East (with a poliomyelitic syndrome). Where both species of ticks occur locally, both types of disease are observed. Perhaps virus is same in both cases, but is modified by species of tick which carries it.

Gastric secretory function in certain injuries of the cerebral cortex. Nevr.  
i psikh., 20, No. 6, 1951.

Study of the secretory functions of the stomach of patients suffering from known and unknown injuries of the brain, but not from traumatic epilepsy, did not ~~show~~ <sup>show</sup> an increase in secretion. The authors therefore assumed that a change in secretory functions of the stomach of patients who suffered from traumatic epilepsy is connected with the beginning of their spasmodic attacks. These attacks characterize the disturbance of ~~normal~~ normal correlation between processes of stimulation and of inhibition in the brain.

Title : Oxygen consumption by tissues and functional state of hemoglobin during  
myasthenia

Periodical : Dok. AN SSSR 100/1, 191-192, Jun. 1, 1955

Abstract : An investigation was conducted to determine the effect of oxygen require-  
ment of tissues on the functional state of hemoglobin during myasthenia.  
A thorough diagnosis of five myasthenic patients showed that hemoglobin  
plays a very important role in the regulation of the respiratory functions  
of the blood. It was established that myasthenia disturbs the trophic  
functions of the tissues which is expressed by reduced intensity of  
tissue respiration. Five USSR references (1946-1953). Table.

1026. THE MAIN PROBLEMS IN THE STUDY OF ACUTE CRANIO-CEREBRAL TRAUMA (Russian text) - Graschenkov N. I., Irger I. M. and Kassil G. N. - VOPR. NEIROKHIR. 1957, 5 (13-17)

In the last 3 yr., 1,588 cases of head injury were examined, 490 of which were operated upon. In man as well as in animals, an increased permeability of the haemato-encephalic barrier occurs, along with a rise of acetylcholine content in the CSF, and an increase in hyaluronidase activity. Treatment, therefore, is directed towards normalization of the barrier and the acetylcholine exchange. From the cases under consideration, 36, or 2.3%, showed a haematoma, 12 of which were located intracerebrally. Out of 95 deaths, 84, or 87.5%, occurred in the first 2 days. Surgical interventions were carried out in both superficial and deep lesions.

658. **VIRUS ENCEPHALITIS TRANSMITTED BY TICKS.** Le virus de l'encéphalite transmissible par tiques. - Grastchenkov N. I. Moscow. - BRUX. - MED. 1957, 37/6 (217-225)

The author starts with a historical survey of the development in knowledge on the Russian spring-summer encephalitis, a virus disease transmitted to man by ticks of the type *Ixodes persulcatus*. The differences between the course of the disease observed in the eastern and western parts of the country and the possible relationship with louping-ill in sheep and with abortive cases of poliomyelitis are discussed. In the western part of the country ticks of the type *Ixodes ricinus* predominate. This is the tick that transmits louping-ill. An extensive description is given of the clinical picture, the pathological anatomy, the therapy, and the fight against the disease.
