TITLE: Optimal encoding of telemetry signals [Paper presented at the Sixth All-Union Conference on Automatic Control and Electric Measurement Methods held in Novosibirsk in September 1964] 14

SOURCE: Avtometriya, no. 3, 1965, 26-33

TOPIC TAGS: telemetry technique, error minimization, dynamic programming, signal coding, successive approximation method

ABSTRACT: Optimal encoding of fully known continuous signals, considered as determined functions of time, is discussed mathematically. The problem reduces itself to the minimization of some error functional, or to determining the minimal value of ϵ -entropy by successive approximation. Dynamic programming is deemed preferable to standard methods of classic analysis, even though it requires the employment of a universal digital computer. Orig. art. has: 23 formulas.

TITLE: A method for the design of special computer devices reducing the excess of experimental data during the study of continuous processes

SOURCE: AN SSSR. Sibirskoye otdeleniye. Izvestiya. Seriya tekhnicheskikh nauk, no. 1, 1965, 32-37

TOPIC TAGS: compact data representation, Fourier coefficient evaluation, empirical function expansion, Chebyshev coefficient, computer input

ABSTRACT: The representation of information in compact form plays an important role during the introduction of data into digital computers or its transfer through limited capacity communication channels. The present paper outlines a method for the integration of a function $f(x)$ with a weight function $\rho(x) = 1/\sqrt{1-x^2}$ ($-1 \leq x \leq 1$) which permits a simple evaluation of the Fourier-Chebyshev coefficients of empirical functions. The proposed approach can be used for a very simple design of specialized computer devices earmarked for a compact representation of experimental data. Orig. art. has: 20 formulas and 1 figure.

TITLE: Determining the maximum deflection angle of the moving component of an
electrometer

SOURCE: AN SSSR. Sibirskoye otdeleniye. Izvestiya. Seriya tekhnicheskikh nauk, no. 3,
1965, 37-41

TOPIC TAGS: electrometer, electrometric amplifier

ABSTRACT: Sensitivity of an electrometric amplifier depends, among other things, on
the maximum permissible angle θ of deflection of the moving component of the
electrometer; hence, increasing the electrometer range may result in considerably
higher output of the amplifier. Formulas are developed which permit determining
 θ_{\max} from a specified nonlinearity of the torque-deflection angle ratio; the torque
curve is approximated by Chebyshev polynomials. A 9-step computation procedure is
suggested. Orig. art. has: 20 formulas.

TITLE: One algorithm for the control of information collection 16C 44P

SOURCE: Avtometriya, no. 4, 1965, 28-35

TOPIC TAGS: algorithm, data acquisition, Legendre polynomial, automatic control design, analog digital converter

ABSTRACT: The authors consider an algorithm for the control of information collection from the source of a continuous signal. Based on the use of orthogonal Legendre polynomials and lacking any differentiation step, the algorithm possesses certain filtration properties due to a double integration of the signal with noise. The structural principle of adaptive discretizers based on the use of Legendre polynomials is analyzed, and it is shown that the error incurred in the uniform approximation of a signal by zero- and first-order orthogonal Legendre polynomials can be rather easily computed. By establishing the relation of this error to the linear integration error of the signal, a functional diagram of an information collection control device for use with this algorithm is presented. In essence, this device controls the time the

Card 1/2

UDC: 62-603

L 41159-66

ACC NR: AF 4115382

test signal is connected to the analog-digital converter. The algorithm discussed for the control of information collection from a continuous signal source is an interpolation algorithm. Unlike well-known extrapolation algorithms, which are based on a prediction of signal properties from the value of the signal itself and its derivatives at a point $t=0$ and which are less flexible (since the approximation line does not undergo a parameter change as the time segment is increased) this algorithm makes it possible to obtain large compression factors. Moreover, using as it does orthogonal Legendre polynomials, this algorithm is superior to extrapolation algorithms in terms of its noise-suppression characteristic because it employs a double integration of the signal. Orig. art. has: 2 figures and 5 formulas.

TITLE: Pulse method for measuring the flow of electrically conductive liquids.
Class 42, No. 168906

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 5, 1965, 78

TOPIC TAGS: electric conductivity, conductive fluid, excitation coil, pulse counter

ABSTRACT: This Author Certificate presents a pulse method for measuring the flow rate of an electrically conducting liquid. The method involves the use of an induced current pulse in the electrically conducting stream. To increase the measurement accuracy, the pulse is determined from the temporary shift of its maximum. The pulse is induced in the measuring coil in relation to a square pulse fed through an excitation coil. This coil is placed on the conduit at a known distance from the measuring coil.

Infrared technology in the food industry (Infrakrasnaya tekhnika v pishchevoy promyshlennosti). Moscow, Izd-vo "Pishchevoy promyshlennost'", 1965. 407 p. illus., tables. 3300 copies printed.

TOPIC TAGS: ~~biological science~~, food technology, ^{IR} infrared radiation, food preservation

PURPOSE AND COVERAGE: Elements of the theory and technology of infrared heating are set forth. The fundamentals of the theory of heating during infrared drying are discussed. Special emphasis is placed on radiative (optical) characteristics of exposed materials. A considerable part of the book is devoted to the technology of infrared heating and its application to food processing. Data for this text were obtained from the Soviet and foreign scientific literature and from research done by various institutes as well as investigations conducted by the author and his students. The book is intended for engineers and scientists specializing in research and application of infrared radiation. The book may also prove beneficial to students in technical schools interested in the food processing industry.

TITLE: Purification of industrial methyl-phenyl dichloro silane
obtained by the method of catalytic dehydrocondensation

PERIODICAL: Plasticheskiye massy, no. 5, 1962, 19-22

TEXT: The composition of industrial methyl-phenyl dichloro silane (I) and its purification from impurities was studied. These are: 0.5-2% dimethyl phenyl chlorosilane (boiling point 195°C), 1-3% phenyl trichlorosilane (boiling point 201.5°C) and 1-3% compounds with hydrogen-silicon bond (methyl phenyl chlorosilane, phenyl dichlorosilane, phenyl chlorosilane etc.). Purification combines separation methods with rectification processes. When treating industrial I with dry air at 150°C, the impurities are oxidized at the SiH bond to high-boiling siloxanes, which can easily be separated from I as follows:

Card 1/2

S/191/62/000/005/006/012
B110/B101

Purification of industrial ...

unchanged. At 150°C, air was ducted through at a rate of 250-280 liter/hr and a ratio of 4 liter air per g I. In order to separate phenyl trichlorosilane from I, partial esterification with isobutyl alcohol (6-8% of the weight of the fraction) was carried through at 40-50°C with subsequent heating to 120-150°C. Dimethyl phenyl chlorosilane was separated from I in a packed column with 25 theoretical plates. The fraction with dimethyl phenyl chlorosilane, ~26-35% of the total charge, may be used for the production of organosilicon varnishes, in the same way as I. I is then distilled off at a reflux ratio of 15-20. The residue of 3-6%, containing polysiloxanes may also be used for organosilicon varnishes. Purified I had the following characteristics:

n_D^{20} = 1.5182-1.5186; d_4^{20} = 1.1762-1.1782; Cl content = 37.00-37.39%; Si content = 14.58-14.82%; MR_D = 49.23-49.28. There are 3 tables.

coagulation and removal of organ rudiments in embryos of *Aristeaenoides*. A. G. Lindberg and T. Dettby (Compt. rend. Acad. Sci. U.R.S.S., 1944, 50, 309-318).—The following experiments were carried out on the early embryos of this primitive fish: (1) removal and grafting of the dorsal lip of the blastopore; (2) removal of presumptive eyes; (3) removal of head brain region. The results indicate that the causal mechanisms operative in the holoblastic eggs of this species are largely the same as those demonstrated in other vertebrates.

TITLE: Monospermy in Sturgeons During Normal Fertilization and the Consequences of Penetration Into the Egg of Supernumerary Spermatozoa (Monospermiya u osetrovikh ryb pri normal'nom oplodotvorenii i posledstviya proniknoveniya v ynytse sverkhchislennykh spermiyev)

PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol. 114, Nr 2, pp. 445-447
(USSR)

ABSTRACT: If the eggs of sturgeons are impregnated with strongly diluted sperm, then the development of the eggs, under favorable conditions, as a rule takes a normal course. They divide into 2, 4, 8 etc. blastomeres. On the other hand, if a weakly diluted sperm is used, there frequently occur disturbances in the process of egg division, supernumerous blastomeres are formed, and later many eggs perish. The author of the present paper assumes that in sturgeons, as well as in anurans, supernumerous blastomeres are caused by penetration of supernumerous sperms. However, in the sterlet observations were

Card 1/2

20-2-60/60

Monospermy in Sturgeons During Normal Fertilization and the Consequences of Penetration Into the Egg of Supernumerary Spermatozoa

made which point exactly in the opposite direction. In order to find an answer to this question, eggs that had been impregnated under different conditions were investigated from a cytological point of view. The results obtained lead the author of the paper under review to the conclusion that normal impregnation in sturgeons is monospermous. Penetration of sperms in greater number, as in impregnation with weakly diluted sperm and at "dry" impregnation, represents a pathological polyspermy as it is accompanied by disturbances in the egg division and in the entire subsequent development. There are 1 figure (10 microreproductions), 1 table and 8 references, 7 of which are Soviet.

ABSTRACT

The Time of Contact Established Between the Egg and the Spermatozoa in Sturgeons.
(Vremya ustanovleniya kontakta spermii s yolkom i oplodotvoronii u osetrovych ryb.)
Doklady Akademii Nauk SSSR, 1957, Vol. 115, Nr. 4,
pp. 845-846 (USSR)

At it was shown earlier the fertilization of sturgeons is normally monospermic. In the case of spawn fertilization, with slightly diluted sperm fertilization by several spermatozoa was frequently observed. In order to understand the way of precaution against the penetration of the excess sperms into the ovum under normal circumstances of the initial stage of the process of fertilization must be studied precisely. This work aims at the investigation of the period from the time of the adding of sperm to the spawn to the contact between the sperms and the ova. For this purpose the author has inactivated the sperms and observed the fertilized eggs; 2) he has fixed the eggs for the cytological examination and observed the passage of the sperms through the little micropylar channels at different times after the fertilization. Sperms of the "star sturgeon" (*Acipenser stellatus* Pall.) and of the

CARD 1/4

The Times of Contact Establishment Between the Egg and the Spermatozoon in
Sturgeons.

Black Acov-Sea sturgeon (*Ac. gueldenstaedti colchicus V. Marti*) which were obtained by means of hypophyseal injections served for the experiments. Experiments for the inactivation of sperms. 7 different surface active preparations were tested. The washing powder "Novest" - Detergent was the most useful. It contains sulphonethers of the cetyl- and stearyl alcohol. This detergent reactivated sperms within less than 0,5 seconds without damaging the eggs. Thus, no fertilization took place in 2434 eggs investigated. An important part of the eggs were fertilized already during the first seconds after the adding of the sperm no matter whether the sperms were highly diluted or highly concentrated. The frequency of the cases of polyspermic fertilization increased rapidly in the first seconds after the fertilization. After the climax of the percentage of the fertilization the polyspermic fertilization ceased to increase. Results of the cytological investigation: The structure of the egg of the sturgeons and the fertilization process is described. The comparison of the knowledge of the structure and of the fertilization with the results of the above experiments led to the conjecture that the contact between the sperm and the zytoplasm of

TITLE: Use of Weibull distribution for calculating the reliability of diesel components

SOURCE: Energomashinostroyeniye, no. 12, 1965, 6-9

component life expectancy, mechanical failure,

TOPIC TAGS: statistic distribution, engine piston, engine cylinder, engine reliability, reliability engineering, marine engine, diesel engine/ 5D50 diesel engine

ABSTRACT: Calculations based on Weibull distribution are proposed for determining the rate of failure of various diesel components since this distribution law takes account of the three cases encountered in operational practice: 1. A reduction in rate of failure with time (for parts which fail during the break-in period), 2. An increase in rate of failure (for the majority of components) and 3. A relatively uniform distribution of rate of failure throughout the entire service life of the engine. Statistical tests on components of various marine diesel engines show entirely satisfactory agreement between the empirical and theoretical distribution for the service life of the components. Curves are given showing the reliability characteristics for some of these components. Data on the 5D50 diesel engine used in whale-

ACC NR: AP6014152

boats show an average piston lifetime of 12800 hours while the average lifetime of cylinder sleeves in this engine is 8870 hours. The rate of failure for pistons shows a continuous increase with time of service due to thermal stresses caused by irregular operating conditions during whaling runs and impairment of piston rings. The proposed reliability calculations may be used to set up preventative maintenance schedules on the basis of predicted component failure. Orig art. has: 2 figures, 5 tables, 9 formulas.

380. Ginzburg, B.L., Generalization of various interpolation formulas for a case of unequal intervals (in Russian), Inzhener, Stornik, Aka. Nauk SSSR 12, 201-220, 1952.

This paper gives formulas for interpolation, numerical differentiation, and numerical integration expressed by means of divided differences. Using a notation for divided differences. Using a notation for divided differences somewhat like Sheppard's notation for central differences in the case of equally spaced abscissas, the author obtains for unequally spaced abscissas the generalizations of Newton's two interpolation formulas. By changes of notation (based essentially on Sheppard's rules) he goes on to get the generalizations of Gauss's Stirling's, Bessel's and Everett's formulas. From these, in turn, he gets formulas for numerical differentiation and integration in terms of divided differences.

Forecasting Agency: USSR. Glavnaya gosudarstvennaya gidrometeorologicheskaya sluzhba.		
Eds. (chief prep.): Yu. N. Matrosov; Ed. (series book): V. I. Tikhonov; Sec. Eds.: V. N. Kartsikas.		
Forecasts: This issue of the Borovoi's forecasts is intended for hydrologists engaged in forecasting work.		
Comments: This collection of articles discusses techniques used in hydrological forecasting. Papers affecting the frequency cycles of rivers are reviewed. The importance of forecasting accuracy in regions where hydroelectric installations are in operation is increased. Extended forecasting techniques and ways of calculating discharge for rivers are discussed. No personalities are mentioned. Borovoi's bibliography contains individual articles.		
Editor-in-Chief: V. I. Tikhonov; Editor-in-Chief of Methods Used for Long-Range Forecasting: V. N. Kartsikas.

sluzhby pri Sovete Ministrov SSSR.

Resp. Edt: V.A. Dryavayev; Eds.: V.S. Protopov; Tech. Ed.: M.I.
Bryzgina.

PURPOSE: This work is intended for meteorologists, hydrologists, and
hydrophysicists, particularly those engaged in the study of snow
and ice and evaporation processes.

COVERAGE: This book contains papers which were presented and discussed at the Third All-Union Hydrological Conference in Leningrad, October 1987. The Conference published 10 volumes on various aspects of hydrology or which this is number 3. The editorial board in charge of the series includes: V.A. Dryavayev (Chairman), O.A. Alekhn, Ye.V. Bilyayev (deceased), O.M. Borovik, N.A. Veilkovsky, L.K. Davydov, A.P. Donsatovskiy, O.P. Gladilin, G.M. Kritskiy, B.I. Rudkin, L.P. Manoil, N.P. Minkov, B.R. Onishchuk, I.V. Popov, A.K. Prokhorovskiy, D.L. Sokolovskiy, O.A. Spesivtsev, A.I. Chobotsarev, and S.M. Chernavskiy. This volume is divided into 2 sections: the first contains reports from the subsections for the study of evaporation processes, and the second contains reports from the snow and ice subsection. References accompany each article.

TITLE: Temperature dependence of the mechanical properties of extruded Penton films

SOURCE: Plasticheskiye massy*, no. 9, 1964, 47-49

TOPIC TAGS: bischloromethyloxacyclobutane, polymer strength, polymer elongation, polymer film, polymer extrusion, thermoplastic polymer, polymer viscosity, Penton, Pentoplast

ABSTRACT: A new thermoplastic material, Penton (polymer of 3,3-bis(chloromethyl)-oxacyclobutane), was investigated in the form of extruded films. First, however, the mol. weight was determined by the reduced viscosity of a 0.5% Penton solution in cyclohexanone at 293K. The viscosity of one batch was 2.53 dl/g (mol. wt. above 200,000) and that of the other was 0.93 dl/g (mol. wt. about 80,000). The films were extruded from granulated material at 483K, the temperature of granulation being 463K. The slight variation in viscosity of Penton during extrusion is tabulated. The temperature dependence of the yield point, tensile strength and relative elongation at break was then investigated over a temperature range of 193-438K. The thickness of the test strips was 0.05-0.10 mm and the experiments were carried out on a Schopper tester of the type FP-3.

Four temperature ranges can be distinguished on the basis of the curves shown in Fig. 1 of the Enclosure. At low temperatures, the mechanical properties change only slightly. In the second temperature range (275-300K), greater changes occur, especially for elongation. In the third temperature range (296 - 428K) the elongation increases considerably, almost linearly with temperature, but the yield point and strength decrease. Finally, over a temperature range of 423-438C, all the mechanical properties vary considerably. The temperature dependence of the mechanical properties of samples cut in the longitudinal and transverse directions was qualitatively the same. In the transverse direction, the brittleness temperature shifted toward higher temperatures ($299 \pm 2K$), the strength decreased slightly and the elongation at break increased slightly near 423K. The temperature dependence of these properties for Penton plastics with a reduced viscosity of 0.9 dl/g showed the same characteristics in the extrusion direction. Great variation in the data for Penton plastics could only be found near the temperatures of brittleness and melting. Below these temperatures, the mechanical properties of the film are comparable to those of cast Penton, and above them, the properties are improved. "The authors are indebted to A. V. Kupfer for the initiation of this investigation, the supply of the polymer samples and valuable comments. They also thank A. V. Fedeyeva for participating in the evaluation of this work and V. A. Denisova for helping to carry out the experiments. Orig. art. has: 4 figures and 1 table.
