**Combustion of fuel by air enriched with oxygen.**  
 M. K. Gerasimov and Z. F. Tschuchanov (J. Appl. Chem. USSR, 1954, 7, 1220-1225).—The main reaction taking place when air is passed over C at > 200° is  $2\text{O}_2 + \text{O}_3 \rightarrow 3\text{O}_2$ , with  $\text{O} + \text{O}_3 \rightarrow \text{OO}$  as a side-reaction; the reaction  $\text{OO}_2 + \text{O} \rightarrow \text{OO}$  does not take place to any significant extent, while oxidation of CO proceeds appreciably when the velocity of flow is small. The length of the combustion zone (l) diminishes, and its temp. rises, with increasing  $[\text{O}_3]$ ; increasing the rate of flow has the opposite effect, owing to the more intense oxidation due to the increased  $\text{O}_3$  supply. The quotient  $\text{CO}/\text{CO}_2$  increases with increase in the active surface of the C, in the rate of flow, and in the  $[\text{O}_3]$ . R. T.

111 AND 112.00011 PROCESSES AND PROPERTIES OF  
  
(a) Mechanism of the catalytic oxidation of  
sulphur dioxide in a solution of manganese salts.  
(b) Action of ozone on solutions of manganese  
salts. M. K. Gaoenkov. J. Phys. Chem. Russ.,  
1925, 6, 478-488, 493-510.—(a) Catalytic oxid-  
ation of  $\text{SO}_2$  in presence of  $\text{Mn}^{++}$  ions occurs through  
the formation of a complex of the type  $\text{Mn}^{++},\text{xSO}_4$ ,

which on oxidation gives  $\text{SO}_3$  and  $\text{Mn}^{+++}$ , the latter  
being then reduced by  $\text{SO}_2$ .

(b)  $\text{O}_3$  accelerates oxidation of the  $\text{Mn}^{++},\text{xSO}_4$   
complex and also oxidizes  $\text{Mn}^{++}$  directly. It destroys  
negative catalyst such as  $\text{PhOH}$ , which are capable  
of poisoning the Mn catalyst.  $\text{O}_3$  does not oxidize  
 $\text{H}_2\text{SO}_4$  directly in 0.7-0.9%  $\text{H}_2\text{SO}_4$ . Ch. Ann. (c)

The combustion of coal by present-day methods.  
M. K. Gerasimov and Z. V. Chukhamev. *Sotsnauk. Rabochie i Nauka* 1958, No. 3, 16-37.—With a strong air blast into CO formed in the primary combustion is carried away without having time to burn to  $\text{CO}_2$ . O not used up in this process reaches the surface of the coal increasing the yield of CO and raising the activity of the fuel. Still greater increase in yield of CO can be obtained by raising the O content of the air instead of increasing the rate of blowing. In combustion CO and  $\text{CO}_2$  are formed independently and their proportion depends on the kind of fuel as well as on the temp.; it is affected by temp. only up to  $1000-1100^\circ$ . The oxidation and reduction zones of ordinary gas generators disappear at high rates of blowing and the oxidizing zone is the lower the greater the intensity of combustion, depending on the O delivered. The high temp. of the process (up to  $2000^\circ$ ) permits (when water vapor is introduced) the reaction  $\text{C} + \text{H}_2\text{O} \rightarrow \text{CO} + \text{H}_2$ , and the lowering of the temp. to  $800-1100^\circ$  in the combustion zone during this reduction is useful. This work is related to the problem of high-power gas generators. In a model of a shaft generator 600 mm. in diam. a 20-fold increase of output is attained. The gases obtained with an air blast have a calorific value higher than 1200 cal./cu. m. B. V. Shvertzberg

CA

High-velocity gasification in the oxygen zone. I. Gasification in the process of carbon combustion (oxidation). M. K. Grigor'evich and Z. P. Chukhanov. Akad. Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Vsesoyuznyi Nauchno-Issledovatel'skiy Institut po Teplofizike i Gidrodinamike, Trudogazoprom 7, Izd. 10 (1960); cf. C.A. 59, 3297, 5625. The products of primary reactions between O and C are CO and CO<sub>2</sub>, the ratio of which varies, depending upon the type of C (kind of fuel). Thus, the greatest amt. of CO (32%) was obtained in the combustion of activated wood charcoal. Nearly the same amt. was obtained in the combustion of wood charcoal, while gas coke and electric carbon produced about 24-25% of CO<sub>2</sub>. At the same time, the amt. of CO<sub>2</sub> left unchanged was 1.2% for the first and 6.8% for the last two. With increase of the velocity and amt. of O passing over the solid, the amt. of CO increases and that of CO<sub>2</sub> decreases. Up to the flash point the velocity of formation of CO is lower than that of CO<sub>2</sub> but the rates of change of that velocity with temp. are equal. At the flash point the velocity of CO formation rises extremely rapidly but that of CO<sub>2</sub> remains the same as before; this may be explained as follows: At this point the CO formation is dead, by the increase of the no. of peripheral C atoms as the result of the increase of velocity, concn. of O, and other reactions on the surface of the C. The actual combustion of C is possible only at high velocity of O passing over the solid which forms only one zone, namely that in which this O is used up, and is conditioned by the rapid removal of CO to prevent further oxidation. The formation of primary CO is greater and the probability of its oxidation is smaller in the combustion

of particles about 5 mm. and less in diam. Twelve references. II. Oxygen zone of gasification. *Ibid.* 1963. An approx. destr. of the O zone shows that with increase of the linear velocity (to a smaller degree) and of the percentage of O in the passing air (to a greater degree) the apparent zone of combustion decreases, although not linearly. The velocities of the reactions: C + CO<sub>2</sub> and C + H<sub>2</sub>O are conditioned by the decompn. of a physico-chem. complex C<sub>2</sub>O<sub>3</sub> which is formed as an intermediary product. The process of the decompn. of water vapor in the O zone is essentially different from the usual reaction: C + H<sub>2</sub>O → CO + H<sub>2</sub>. The admist. of an inert gas causes incomplete consumption of O and, therefore, the heat is insufficient to accomplish the high-velocity process.

- TITLE: Dust Separators of the Taganrog Boiler Works - All-Union Thermo-Technical Institute Type for High-output Mills
- PERIODICAL: Teploenergetika, 1959, Nr 9, pp 92-94 (USSR)

ABSTRACT: This article is a brief catalogue-style description of dust separators designed by the Taganrog Boiler Works - All-Union Thermo-Technical Institute (TKZ-VTI) for use with ball mills of output ranging from 10 to 50 tons per hour of anthracite dust. In many respects the separator is an improvement on earlier designs. It is designed to deliver dust with 6 to 28% residue on a 90 mesh sieve, which is satisfactory when used in conjunction with ball mills operating on anthracite dust and hard coal. In particular cases they may also be used with brown coal. However, for prolonged coarse milling of brown coal, other types of separator are recommended. The separator is of all-welded construction and the main parts to be erected are briefly described. The main dimensions and weights of the separators are given in Table 1 and an outline drawing in Fig 1. To select the right size of

TOPIC TAGS: seismograph, correlation statistics

ABSTRACT: Author's Certificate No. 186152, dated 23 December 1964, has been issued to Yu. P. Lukashin and T. M. Grodzyanskaya for a method described as follows: "A method for correlation analysis of seismic records of a continuously moving source of stationary mechanical oscillations. It differs in that for the purpose of speeding up the processing of magnetograms and accomplishing filtration of velocities by the use of frequency filters it is possible to determine the current reciprocal correlation functions of the records of the seismic detector and oscillator during the integration time, determined by the length of the useful wave, and the recorded values of the relative shift between the records to be correlated for each trace. TITLE: A method for seismic mapping of bedrock. Class 42, No. 187329 [announced by the All-Union Scientific Research Institute of Exploratory Geophysics (Vsesoyuznyy nauchno-issledovatel'skiy institut razvedochnoy geofiziki)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 20, 1966, 129

TOPIC TAGS: seismologic instrument, mapping

ABSTRACT: This Author's Certificate introduces a method for seismic mapping of bedrock. The procedure is based on determining the mutual correlation function of seismic detector recordings using a continuously moving vibrator. The effectiveness of seismic prospecting is increased by determining the mutual correlation function of the seismic detector recordings at the ends of the base of observations while continuously moving the vibrator on the linear continuation of the base. The signals are integrated over a time interval corresponding to the motion of the vibrator within the limits of the adjacent base of observations.

TITLE: Behavior of sulfur in the blast furnace process

SOURCE: Hutnické listy, no. 8, 1965, 545-552

TOPIC TAGS: sulfur, blast furnace, oxidation, slag, iron, metal extraction, chemical reduction, carbon

ABSTRACT: Changes in the physical and chemical state of sulfur entering the blast furnace with the burden and with the fuel are discussed. Oxidation of sulfur to dioxide, and the reduction of the dioxide by carbon, carbon monoxide, and hydrogen are discussed. Carbon disulfide, carbon monosulfide, carbonyl sulfide and hydrogen sulfide are formed; changes in their concentration according to the reaction temperatures are described. Most of the sulfur and its compounds are retained by the burden, the slag, and the iron; only a small part is discharged from the furnace with the gases. The content of sulfur in the waste gas depends on the smelting process used, on the solids in the charge and their ability to hold sulfur, and on the temperature profile of the furnace.

"Investigation of the Histamine Content of the Eye"

Budapest, A MTA Biologiki és Orvosi Tudományok Osztályának Közlemenyesi, Vol 13, No 4, 1962; pp 311-320.

Abstract: [Authors' Hungarian summary] Authors determined the total histamine content of the tissues of bovine eye on surviving guinea-pig intestine, using the Farsoun-Gaddum-Code method. On the basis of the obtained results the tissues of the eye may be classified, according to the amount of histamine present, into the following four groups: (1) Significant amounts of H (histamine) contained in the optic nerve ( $5.27 \pm 0.44$  gamma/g), the conjunctiva ( $4.14 \pm 0.15$ ) and the eye muscle ( $1.79 \pm 0.22$ ). (2) Moderate amounts of H in the sclera ( $0.65 \pm 0.07$ ) and the iris ( $0.60 \pm 0.15$ ). (3) Small amounts of H in the c.ciliare ( $0.39 \pm 0.08$ ), the choroidnea ( $0.33 \pm 0.07$ ) and the cornea ( $0.17 \pm 0.03$ ). (4) barely detectable amounts of H in the retina and lens. [82 references, mostly Western].

"The Relationship Between Preference of the Upper Extremity and the Conduction Velocity of Motor Fibers in N. Ulnaris."

Prague, Activitas Nervosa Superior, Vol 8, No 2, Jun 66, pp 207-208

Abstract: Maximal and terminal velocities and terminal and residual latency were determined in 30 healthy subjects aged 20 - 40 years. The n. ulnaris of the preferred extremity showed no higher values than the other n. ulnaris. Sex, age and axillary temperature had no effect on the results. 1 Figure, no references. Submitted at the 4th Conf. of Exper. and Clin. Study of Higher Nerv. Functions at Mar. Lazne, 12-15 Oct 65. Article is in English.

"Experience with Fluphenazine in the Treatment of Anxiety in Endogenous Depressions (Orientalative Comparison with Chlorpromazine by Means of an Intensive Double-Blind Project.)."

Prague, Ceskoslovenska Psychiatrie, Vol 62, No 4, Aug 66, pp 254 - 257

Abstract /Authors' English summary modified/: 8 women were treated for endogenous type depressions by standard doses of imipramine, and the therapeutic effect of fluphenazine and chlorpromazine on the anxiety aspect and on the overall clinical condition of the patients was studied. Comparison of the two drugs was made on the basis of the Chassan double-blind test. No significant differences between the effect of the two drugs were found. Economical advantages of the method are discussed. 1 Table, 1 Western, 1 Czech reference. (Manuscript received 24 Apr 65).

"Treatment of Depression by a Combination of Nortriptyline and Amitriptyline. (Extensive Comparison with Imipramine)."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, pp 381 - 383

Abstract: Treatment of 27 patients suffering from endogenous depression is described. The effect of nortriptyline appears within 2-3 days, but disappears eventually; amitriptyline starts to be effective only in the 2nd or 3rd week of treatment, but has a longer lasting effect. The combination of the 2 drugs gave better results than imipramine as far as the tendency to suicide, selfmutilation, and despair are concerned. Imipramine was better because it did not reduce the appetite, or cause a loss of weight.

"Maintenance and Prophylactic Doses of Imipramine in Recurrent Depressions."

Prague, Activitas Nervosa Superior, Vol 6, No 4, "ov 66, pp 383 - 385

Abstract: A study of 31 female patients suffering from depression is described. In each patient the length of 3 remissions following 3 successive depressive phases was investigated. After the termination of a phase the patient was kept for 6 weeks on maintenance doses of the drug which helped in the recovery. It seemed that in some patients the maintenance dose increased the length of the remission periods, while in others it shortened them. No definite conclusion could be drawn from the results of the experiment. 1 figure, 4 Western, 3 Czech, 1 Russian reference. Submitted at the 8th Annual Psychopharmacological Meeting at Jesenik, 18 - 22 Jan 66. Article is in English.

"Influence of the Family Environment on the Origin and Development of Schizophrenia."

Prague, Ceskoslovenska Psychiatrie, Vol 59, No 5, 1963, pp 340-354

Abstract: The information obtained by the study of the family environment of schizophrenics, and the results of investigation of the genetics are the most constant sources of information relative to the origins of the disease. Some authors believe, that the results of the investigation of genetics may be interpreted in the light of non-hereditary transmission. Mental disorders are not caused by simple genetical transmission, but are caused by upbringing in the family and mental interaction with mentally ill relatives. It seems that this approach needs more thorough investigation before final judgment of this question could be made.

Part I. Relationship between neurotic symptoms and interpersonal situation

21

SOURCE: Ceskoslovenska psychiatrie, no. 5, 1965, 303-313

TOPIC TAGS: psychoneurotic disorder, psychology, psychotherapy, psychiatry

ABSTRACT: Study of 9 women and 9 men, all severe neurotics admitted for 5 weeks hospitalization, with very strict and detailed observation and questionnaire analysis. Initial severity of the neurotic symptoms had no apparent bearing on the attitudes of other patients toward the newcomer, but this attitude did have a very strong effect on the evolution of the neurosis; friendly or submissive attitude of the environment decreased symptoms markedly, whereas hostility of the other patients made the symptoms more severe. "Rating Scale FKP. (Quantification of Psychiatric Symptomatology  
for the Evaluation of Pharmacotherapy Psychoses)."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, pp  
405 - 408

Abstract: Evaluation of factors used in the rating scale is discussed. In the symptomatology quantifiable bipolarly the following aspects are used as components: sleep, food, mood, self-evaluation, affective reactions, motor activity, speech rate and changes of the subjects of speech, uncooperativeness, sociability, and appearance. In the symptomatology not classifiable bipolarly the factors used are: disorientation, anxiety and fear, aggressiveness, hallucinations, delusions, thinking, dissimulation, and insight. 1. A study of methods for the determination of the specific surface of milling products, by J. Grotzsch and K. Vagel. ("Ergänzung" — Building Materials — Vol. II, No. 11-12, pp. 629-634, Dec., 1959, 8, tab.).

For the purpose of standardizing methods of determination of the specific surface and its introduction to the industry, the existing methods of testing specific surfaces were studied thoroughly and were also submitted to a critical evaluation by the Research Institute for the Heavy Chemical Industry. The article contains an account of the results of this study, and the first part deals with the various methods of determination, i. e., among others, with that of Neppen, G. Martin, whose methods of determination are based on the velocity of solution in a corrective agent, and, whereas, L. A. Wagner suggested a method based on light absorption. P. C. Farmer derives his method, founded on a new principle, by mathematical computation. The second part of the article is devoted to the Lee-Carman porosity-surface, and the principle of surface determination based on this method; the values thus obtained are compared with those computed according to the sedimentation process.

45. The determination of the quantity of mullite in  
baked ceramic products - *Mullit mennyiségek meg-*  
*határozza elött kerámia termékekben* - J. Grofcsik and  
E. Vágó, (Building Materials) *Füzetek*, Vol. 4,  
1952, No. 11-12, pp. 211-215, 5 figs., 6 tabs.)

Finding the optimal conditions for the formation of mullite, such as baking time, composition of the raw material, catalysts, etc. is very important in the manufacture of both refractories and ceramics. A rapid and accurate method for determining the mullite content of the baked products is therefore necessary. If the material to be examined is finely pulverized with 15% ammonium chloride it can be moulded with Canada balsam into 0.4-0.5 mm dia. sticks for *Debye-Scherrer* X-ray tests. X-ray photos are subsequently made of the mixture with  $CuK\alpha$  rays, Ni filter, 32 kv and 15 mA; after which the intensity of the 4.30 Å and 0.015 Å lines can be determined photometrically. The intensity of the lines is proportional to the quantity of mullite present. This method yields very accurate results which are not influenced by the possible presence of sillimanite,  $\beta$ -cristobalite or corundum. D. Veresdy

fications). Besides the specific gravity determination, the process of polymorphous conversions of quartz was studied also roentgenographically, the pictures indicating the presence of christobalite and unaltered quartz but not tridymite, although the specific gravity of the obtained calcined quartz glass was about 2.3 g per cub.cm. The x-ray data refute the generally accepted opinion that tridymite is the most important component of Dinas and prove that the methods recommended for the determination of the mineralogical composition of refractory Dinas are not applicable.

"Relationship Between Autonomous Functions and Spontaneous Potentials from Parietal and Occipital Cortex and from Hippocampus in Non-anesthetized Dogs at Rest."

Prague, Activitas Nervosa Superior, Vol 8, No 2, Jun 66, pp 185-187

Abstract: Correlation of the spontaneous potentials with the pulse and respiratory rate is discussed. Experiments with two dogs weighing 15 kg are described. In one dog a significant correlation of the pulse rate and parietal cortex voltage was found. In both dogs a correlation of respiratory rate and hippocampus voltage was found. No correlation of pulse rate and the hippocampus or occipital cortex voltage was found. The integrated voltage registered by a normal EEG apparatus is tonically specific for a given brain structure. A functional correlation of the respiratory rate to spontaneous potentials in certain brain structures can be found by voltage integration. 2 Figures, 1 Table, 6 Western, 1 Czech references.
