AUTHOR: Ionescu, D. V.

TITLE: The application of successive approximations to the numerical integration of differential equations

PERIODICAL: Referativnyy zhurnal, Matematika, no. 7, 1962, 26, abstract 7V129. ("Bull. math. Soc. sci. math. et phys. RPR", 1959, 3, no. 4, 423-431)

TEXT: The approximate solution of the equation $y' = f(x, y)$ with the initial condition $y(x_0) = 0$ is determined by the successive approximations

$$y^{(0)}(x) = \int_{x_0}^x f[\xi, 0] d\xi, \quad y^{(s)}(x) = \int_{x_0}^x f[\xi, y^{(s-1)}(\xi)] d\xi \quad (s=1, 2, 3, \dots)$$

It is suggested that the values of $y^{(s)}(x)$ in the points x_1, \dots, x_n be calculated using an improved trapezoid formula, thereby using the obtained values

$y^{(s-1)}(x_i)$. The necessary exactness of the approximate solution in the Card 1/2

TITLE: Application of the method of successive approximations to the numerical integration of differential equations

PERIODICAL: Referativnyy zhurnal, Matematika, no. 12, 1962, 29 - 30, abstract 12V156 (Studii și cercetări mat. Acad. RPR Fil. Cluj, 1960, v. 11, no. 2, 273 - 286; Rumanian; summaries in Russian, French)

TEXT: A numerical realization is constructed for the known method of Picard's successive approximations for the solution of the Cauchy problem

$$y' = f(x, y), \quad y(x_0) = y_0, \quad (1)$$

consisting in that the segment $x_0 \leq x \leq x_0 + \gamma$ of the x line is covered by a grid Γ with points $x_0, x_1, \dots, x_n = x_0 + \gamma$ and at the v -th step of the process

$$y^{(v)}(x) = \int_{x_0}^x f(\xi, y^{(v-1)}(\xi)) d\xi, \quad v = 1, 2, \dots \quad (2)$$

Card 1/3

S/044/62/000/012/031/049

A060/A000

Application of the method of successive

one defines the quantities $y^{(v)}(x_i)$, $i = 1, \dots, n$, and the integrals

$$\int_{x_0}^{x_1} f(\xi, y^{(v-1)}(\xi)) d\xi$$

are calculated by the quadrature formula

$$\int_{\alpha}^{\beta} \Phi(x) dx = \frac{\beta - \alpha}{2} [\Phi(\beta) + \Phi(\alpha)] - \frac{(\beta - \alpha)^2}{12} [\Phi'(\beta) - \Phi'(\alpha)] + R, \quad (3)$$

$$R = \frac{1}{24} \int_{\alpha}^{\beta} (x - \alpha)^2 (\beta - x)^2 \Phi^{IV}(x) dx.$$

The following theorem is proven: Let: 1) the function $f(x, y)$ be defined on the rectangle $D(x_0 \leq x \leq x_0 + a; |y| \leq b)$ and let it have partial derivatives of the first four orders with respect to x and y continuous in that rectangle; 2) $y(x_i)$ be the exact solution of the problem (1) determined at the i -th point

Card 2/3

S/044/62/000/012/031/049
A060/A000

Application of the method of successive

of the grid Γ , and $y_1^{(v)}$ be the approximate solution of that problem calculated at the v -th step of the Picard process (2) according to the quadrature formula (3), neglecting the remainder term R at that grid point; 3) δ be a specified number from the segment $0 < \delta < b$, $M = \sup_D |f(x, y)|$, $\gamma = \min \left(a, \frac{b-\delta}{M} \right)$, ϵ is any prespecified positive number. Then there exists an approximation number v and a grid Γ of grid points x_0, x_1, \dots, x_n such that the inequality

$$|y(x_i) - y_1^{(v)}| \leq 2\epsilon$$

is satisfied for all the grid points of the grid Γ . In the case of a uniform grid Γ , i.e., $x_i = x_0 + ih$, $h = \frac{\gamma}{n}$, $i = 0, 1, \dots, n$, inequalities are established from which on the basis of the specified ϵ one also finds the number n of its grid points and the number v of its approximation. Here it is assumed that no errors of computation are admitted in the process of realizing the constructed computational algorithm.

TITLE: Numerical integration of a Volterra-type integral equation

PERIODICAL: Studii si cercetări de mecanică aplicată,
no. 1, 1961, 175 - 183

TEXT: Considering a non-homogeneous Volterra-type integral equati-
on

$$\varphi(x) + \int_a^x K(x,t)\varphi(t) dt = f(x) \quad (1)$$

the author attempts to determine in this article a network of knots in arithmetic progression, on the [a, b] interval, corresponding to a given, positive number ε , as well as an algorithm for calculating some $c_i(p)$ numbers, where $p = 0, 1, \dots, v$, in order to

Card 1/12

23034
R/008/61/000/001/009/011
D237/D301

Numerical integration of ...

obtain $|\varphi(x_i) - \varphi_i^{(v)}| < 2\epsilon$, on all x_i knots of the T network. The operation method is similar to the one regarding the numerical integration of differential equations and of equations with hyperbolic-type partial derivatives, presented at the Colloviul de Mecanică (Mechanical Colloquium) in Bucharest on October 25 - 29, 1959, and at the Colloviul de teoria ecuațiilor cu derivate parțiale (Colloquium of the Theory of Equations with Partial Derivatives) in Bucharest on September 21 - 26, 1959. In the integral equation (1) it is assumed that the function $f(x)$ is continuous in the $[a, b]$ interval and that the nucleus $K(x, t)$ is a continuous function of x and t in the triangle T defined by

$$a \leq x \leq b, \quad a \leq t \leq x. \quad (2) \quad (2)$$

The integral $\varphi(x)$ is the sum of the series

$$\varphi^{(0)}(x) + [\varphi^{(1)}(x) - \varphi^{(0)}(x)] + \dots + [\varphi^{(v)}(x) - \varphi^{(v-1)}(x)] + \dots \quad (4)$$

Card 2/12

23034

R/008/61/000/001/009/011
D237/D301

Numerical integration of ...

which is absolutely and uniformly convergent in the $\overline{[a, b]}$ interval. The author then deduces

$$|\varphi(x) - \varphi^{(p)}(x)| \leq F_0 e^{K_0(b-a)} \frac{K_0^{p+1} (b-a)^{p+1}}{(p+1)!},$$

in which F_0 and K_0 are the upper limits of $|f(x)|$ and $|K(x, t)|$ in the $\overline{[a, b]}$ interval and the triangle T . Since ε is a given positive number, the natural number p can be selected so that

$$|\varphi(x) - \varphi^{(p)}(x)| < \varepsilon, \quad (6)$$

for every x in the $\overline{[a, b]}$ interval. The number p remains fixed in the whole work. For the numerical integration of Eq. (1), the following supplementary hypotheses are established for the function $f(x)$ and for the nucleus $K(x, t)$: 1) The function $f(x)$ has the continuous derivatives $f'(x)$, $f''(x)$ in the $\overline{[a, b]}$ interval; and 2) The nucleus $K(x, t)$ has the continuous partial derivatives

Card 3/12

23034
R/008/61/000/001/009/011
D237/B301

Numerical integration of ...

$\frac{\partial K}{\partial x}, \frac{\partial K}{\partial t}, \frac{\partial^2 K}{\partial x^2}, \frac{\partial^2 K}{\partial t^2}$ in the T triangle. From here, it can be deduced that the functions $\varphi^{(p)}(x)$, in which $p = 0, 1, \dots, v$ have continuous derivatives of the first and second order in the $[a, b]$ interval. Denoting by F_0, F_1, F_2 the upper limits of $|f(x)|, |f'(x)|, |f''(x)|$ on the $[a, b]$ interval, the author obtains

$$|\varphi^{(0)}(x)| \leq F_0, |\varphi^{(1)}(x)| \leq F_1, |\varphi^{(0)}(x)| \leq F_2. \quad (8)$$

Denoting by $K_0, K_{10}, K_{01}, K_{20}$ and K_{02} the upper limits of

$$|K(x, t)|, \left| \frac{\partial K}{\partial x}(x, t) \right|, \left| \frac{\partial K}{\partial t}(x, t) \right|, \left| \frac{\partial^2 K}{\partial x^2}(x, t) \right|, \left| \frac{\partial^2 K}{\partial t^2}(x, t) \right|,$$

in the T triangle, the author deduces that

$$|\varphi^{(p)}(x)| \leq F_0 + K_0 \int_a^b |\varphi^{(p-1)}(t)| dt, \quad (9)$$

Card 4/12

23034

R/008/61/000/001/009/011
D237/D301

Numerical integration of ...

$$|\varphi^{(p)}(x)| \leq F_1 + K_0 |\varphi^{(p-1)}(x)| + K_1 \int_a^x |\varphi^{(p-1)}(t)| dt, \quad (9)$$

$$|\varphi^{(p)}(x)| \leq F_2 + (2K_{10} + K_{01}) |\varphi^{(p-1)}(x)| + K_0 |\varphi^{(p-1)}(x)| + \\ + K_{20} \int_a^x |\varphi^{(p-1)}(t)| dt. \quad (9)$$

Eqs. (8) and (9) supply the upper limits of the functions $|\varphi^{(p)}(x)|$, $|\varphi^{(p)}(x)|$, $|\varphi^{(p)}(x)|$ in the $\overline{a}, \overline{b}$ interval. The upper limits of the latter functions are denoted by Φ_0 , Φ_1 , Φ_2 in the $\overline{a}, \overline{b}$ interval for all values of the index p , $p = 0, 1, \dots, v$. On the basis of these considerations, the functions $\psi^{(p)}(t)$ are expressed by

$$\psi^{(p)}(t) = K(x, t) \varphi^{(p)}(t) \quad (10)$$

Card 5/12

23034

R/008/61/000/001/009/011
D237/D301

Numerical integration of ...

in which x is a number from the interval $\overline{a}, \overline{b}$. The upper limit of $|\psi^{(p)}(t)|$ in the $\overline{a}, \overline{b} < \overline{a}, \overline{b}$ interval is finally given by

$$|\psi^{(p)}(t)| < N, \quad (11)$$

for all values of the index p , i.e. $p = 0, 1, \dots, v$, in which N is: $N = K_{02} \phi_0 + 2K_{01} \phi_1 + K_0 \phi_2$. The author determines a network on the $\overline{a}, \overline{b}$ interval, consisting of the knots $a, x_1, \dots, x_{n-1}, b$ and an algorithm for calculating the $\varphi_i^{(p)}$ numbers for $p = 0, 1, \dots, v$, in order to have for the knots of the T network $|\varphi_i^{(v)}(x_1) - \varphi_i^{(v)}| < \varepsilon$, ($x_0 = a, x_n = b$). Since $\varphi_i^{(0)}(x) = f(x)$, one may take

$$\varphi_i^{(0)} = f(x_i). \quad (12)$$

Card 6/12

23034

R/008/61/000/001/009/011
D237/D301

Numerical integration of ...

The interval $[a, b]$ is divided into n equal parts in the points x_1, x_2, \dots, x_{n-1} , thus forming the Γ network from the knots $x_0, x_1, \dots, x_{n-1}, x_n$. Selecting the number n to be equal with the smallest natural number which fulfills the condition

$$N \frac{(b-a)^3}{12n^2} < \epsilon_1. \quad (15)$$

the author deduces

$$\varphi^{(1)}(x_i) = \varphi_i^{(1)} - R_i^{(1)}, \quad (17)$$

in which $|R_i^{(1)}| < \epsilon_1$. The author then deduces $\varphi^{(2)}(x_i)$, given by

$$\varphi^{(2)}(x_i) = \varphi_i^{(2)} + R_i^{(2)}, \quad (24)$$

$$R_i^{(2)} = p_i^{(2)} - r_i^{(2)},$$

Card 7/12

23034

R/008/61/000/001/009/011
D237/D301

Numerical integration of ...

in which $R_i^{(2)} = \varphi_i^{(2)} - r_i^{(2)}$, and on the basis of certain inequalities previously mentioned by the author:

$$|R_i^{(2)}| \leq (1 + Q) \epsilon_i. \quad (25)$$

in which Q is expressed by

$$Q = (b - a) K_0. \quad (25)$$

In a general case, for the index $p - 1$ one has

$$\varphi_i^{(p-1)}(x_i) = \varphi_i^{(p-1)} + R_i^{(p-1)}, \quad (26)$$

in which $\varphi_i^{(p-1)}(x_i)$ and $/R_i^{(p-1)}/$ are expressed by

$$\begin{aligned} \varphi_i^{(p-1)} &= f(x_i) - \frac{b-a}{2n} \left[K(x_i, x_0) \varphi_0^{(p-2)} + K(x_i, x_1) \varphi_1^{(p-2)} + \right. \\ &\quad \left. + 2 \sum_{j=1}^{i-1} K(x_i, x_j) \varphi_j^{(p-2)} \right], \end{aligned} \quad (27)$$

Card 8/12

23034

R/008/61/000/001/009/011
D237/D301

Numerical integration of ...

and

$$|R_i^{(p-1)}| \leq (1 + Q + \dots + Q^{p-2}) \varepsilon_1, \quad (28)$$

which is accurate for $p = 3$. Using for $\varphi_i^{(p)}(x_i)$ and $\varphi_i^{(p)}$ the formulae

$$\varphi_i^{(p)}(x_i) = [\varphi_i^{(p)}] - r_i^{(p)}, \quad (29)$$

and

$$\begin{aligned} \varphi_i^{(p)} = f(x_i) - \frac{b-a}{2n} & \left[K(x_i, x_0) \varphi_0^{(p-1)} + K(x_i, x_i) \varphi_i^{(p-1)} + \right. \\ & \left. + 2 \sum_{j=1}^{i-1} K(x_i, x_j) \varphi_j^{(p-1)} \right], \end{aligned} \quad (31)$$

respectively, the author deduces for $\varphi_i^{(p)}(x_i)$ the formula

$$\varphi_i^{(p)}(x_i) = \varphi_i^{(p)} + R_i^{(p)}, \quad (34)$$

Card 9/12

23034
R/008/61/000/001/009/011
D237/D301

Numerical integration of ...

in which $\varphi_i^{(p)}$ is given by (31), while $R_i^{(p)} = \varphi_i^{(p)} - r_i^{(p)}$. For $|R_i^{(p)}| / R_i^{(p)}$ he deduces

$$|R_i^{(p)}| \leq (1 + Q + \dots + Q^{p-1}) \varepsilon_1 \quad (35)$$

For calculating the relative $\varphi_i^{(p)}$ numbers at the knots of the Γ network, the author deduced an algorithm. For the knots of the Γ network, there is the formulae (34), in which the $R_i^{(p)}$ verifies the inequality (35). For $p = v$,

$$\varphi_i^{(v)}(x_i) = \varphi_i^{(v)} + R_i^{(v)}, \quad (36)$$

in which

$$|R_i^{(v)}| \leq (1 + Q + \dots + Q^{v-1}) \varepsilon_1. \quad (37)$$

Card 10/12

23034

R/008/61/000/001/009/011
D237/D301

Numerical integration of ...

$$\text{Selecting } \varepsilon_1 \text{ in such a way that } (1 + Q + \dots + Q^{-1}) \varepsilon_1 \leq \varepsilon_1 \quad (38)$$

$$\text{in the formula (36) there will be } R_i^{(v)} \leq \varepsilon, \quad (39)$$

Returning to the (x) integral of Eq. (1), the following identity may be established:

$$\varphi(x_i) - \varphi_i^{(v)} = \left[\varphi(x_i) - \varphi_i^{(v)}(x_i) \right] + \left[\varphi_i^{(v)}(x_i) - \varphi_i^{(v)} \right], \text{ and the inequalities (6) and (36) show that:} \quad (40)$$

$$|\varphi(x_i) - \varphi_i^{(v)}| < 2\varepsilon.$$

Thus, at a given positive number ε , a network Γ on the $[a, b]$ interval could be determined by inequalities (15) and (38) and the calculation algorithm for the numbers $\varphi_i^{(p)}$, in which $p = 0, 1, \dots, v$, so that $\varphi_i^{(v)}$ has to represent approximately the values of the $\varphi(x)$ integral on the knots of the Γ network, also obtaining the inequality (40).

AUTHOR: Ionescu, D. V. (Cluj)

TITLE: Generalization of V. N. Fadeeva's numerical derivation equation

SOURCE: Polska Akademia Nauk. Instytut Matematyczny. Annales polonici mathematici, v. 14, no. 2, 1964, 169-181

TOPIC TAGS: numerical derivation equation, polynomial, integral, analysis, theory of functions, Fadeeva derivation equation, differential equation

ABSTRACT: The author generalizes the numerical derivation equation

$$\Delta^* f(x_0) = \frac{h}{2} [f''(x_0) - f''(x_1)] + R$$

studies the remainder which is stated in the form of a definite integral; and demonstrates the numerical integration of the differential equations. Author establishes the equation

Card 1/43

ACCESSION NR: AT4034527

$$\Delta^{n-1}f(x_0) = A_1 f'(x_1) + A_2 f'(x_2) + \dots + A_n f'(x_n) + R,$$

in which the remainder R should be zero when $f(x)$ is any n degree polynomial whatsoever. The coefficients A_1, \dots, A_n are determined and its remainder is studied with the result that $A_k = (-1)^k A_{n-k+1}$ and, if $n = 2p + 1$, then $A_{(n+1)/2} = 0$. The derivative $\varphi_j^{(n+1)}(x)$ have a single zero in the interval $[x_j, x_{j+1}]$; point $x = (x_j + x_{j+1})/2$. It is seen that

$$R_j = (-1)^{j-1} \frac{(n-3)(n-4)\dots(n-j-1)}{(j-1)!}$$

and

$$\varphi_j^{(n-1)}(x_j) + \varphi_j^{(n-1)}(x_{j+1}) = 0.$$

Author demonstrates that the function $\varphi(x)$ is negative in the interval (x_1, x_n) . Therefore, the remainder R of the numerical derivation equation becomes

Card 2/53

ACCESSION NR: AT4034527

$$R = f^{n+1}(s) \int_a^b \varphi(s) ds,$$

which yields

$$R = -f^{n+1}(s) h^{n+1}/12$$

and

$$|R| \leq M_{n+1} h^{n+1}/12,$$

If the integral of the differential equation

$$y' = f(x, y)$$

which satisfies the condition $y(x_0) = y_0$ was previously calculated for the nodes x_2, x_3, x_4, x_5, x_6 , the integral can be calculated by node x_1 ; x_6 can be determined by the Adams numerical integration equation. Orig. art. has: 55 equations.

AUTHOR: Ionescu, D.V.

TITLE: Some practical formulas for the numerical integration of differential equations

SOURCE: Revue Roumaine de mathematiques pures et appliquees, v. 9, no. 3, 1964,
237-243

TOPIC TAGS: Adams formula, differential equation, numerical analysis, numerical
integration, quadrature

ABSTRACT: The present paper considers the numerical solution of the differential
equation $y' = f(x, y)$ with the boundary value of $y(x_0) = y_0$, the equation being solved
over the interval $[x_0, x_0 + a]$. Certain generalizations of Adams' formula are developed
yielding quadrature formulas of the following sorts: let x_0, x_1, \dots, x_6 be points in an
arithmetic progression with difference h , a certain rectangular region D , $f_n(x, y) = y^{(n)}$,
and

$$F_h = \sup_{(x,y)} |f_n(x, y)| \quad (1)$$

TITLE: Activation of the cooling water in the primary circuit of the BBP-C-MAE (VVR-S-IAR) reactor in Bucharest

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 12, 1962, 377; abstract 12K24 (Rev. phys. Acad. RPR, v. 6, no. 3, 1961, 299-304)

TEXT: Long- and short-lived isotopes, products of the corrosion of Al and stainless steel, were determined by filtration of the water from the primary circuit of the reactor on an ion-exchange filter and detection of beta-active isotopes from the curves of their absorption in Al, and gamma-active isotopes by scintillation gamma-ray spectroscopy. It is suggested that the radioactivity of the water is caused by the presence of Mg²⁷, Mn⁵⁶, Na²⁴, Ni¹⁰⁷, Fe⁵⁹, Sr⁸⁹, Ta¹⁸², Ag¹¹⁰ and Co⁶⁰.

method of roasting bauxites with CaO and Na₂CO₃. Results are given of experiments conducted by the Institute of Chemical Research for increasing the yield of Al₂O₃ from bauxite and increasing production of the ore by the use of concentrated solutions of alkaline aluminate while lowering the production costs of the final product and obtaining Al₂O₃ of high purity. A detailed study was made (under laboratory conditions) and optimum parameters were chosen for bauxite calcination, and the extraction of Al₂O₃ from it was studied. A check of the selected methods under industrial conditions demonstrated the possibilities of obtaining Al₂O₃ of high purity from Rumanian bauxites with a yield

ABSTRACT: A report on the work of the Central Dyeing Laboratory of the Romanian People's Republic for determining the dying behavior of the acid dyes used in Rumania in order to prescribe optimum application conditions. Some information is also given on the influence of fiber type, dyeing bath on the solubility of acid wool dyes and on certain other properties. From the results some conclusions are drawn concerning the structure of acid dyes in general. Orig. art. has: 1 formula, 1 figure, 10 tables, 8 graphs.
