AUTHOR: Kabanov, V. A.; Kargin, V. A.

TITLE: Autocatalysis in polymerization reaction

SOURCE: AN SSSR. Doklady*, v. 150, no. 5, 1963, 1073-1076

TOPIC TAGS: autocatalysis, polymerization reaction, diffusion, jelly-effect, autocatalytic acceleration, growth rate, autocatalytic polymerization

ABSTRACT: Acceleration of polymerization reactions during accumulation of polymer in a system usually is connected with a decrease of constant of the rate of kinetic chain breaking, as a function of the difficulty of diffusion of active polymer nuclei as influenced by increase in viscosity of the medium (jelly-effect). There are other possibilities for autocatalytic acceleration, combined, for example, with an increase of chain growth rate constant if the active nucleus appears in contact with already prepared macromolecule or an aggregate of macromolecules. There is interest in the study of autocatalytic polymerization exhibited by systems for which breaking reactions are not combined with collisions of two macroradicals, since it is difficult to isolate the matrix effect from the jell-effect. Equations for propagation, chain growth, and chain breaking are given as a simple kinetic schematic of autocatalysis polymerization. "In

TITLE: Polymerization of quinoline and autocatalysis forming macromolecules with conjugate system

SOURCE: AN SSSR. Izv. Seriya khimicheskaya, no.2, 1964, 391-392

TOPIC TAGS: quinoline polymerization, quinoline autocatalysis, quinoline, autocatalysis, autocatalytic reaction, quinoline zinc chloride complex

ABSTRACT: Seeking autocatalytic reactions having general applications the authors investigated the polymerization of the quinoline-zinc chloride complex ($\text{Qui}_2\text{ZnCl}_2$) in the presence of catalytic quantities of proton-containing substances (HPO_3 , $\text{Qui}\cdot\text{HCl}$) over the temperature range of 250-370°C. They obtained polymer products varying in color from red to black (depending upon the conditions). They were polyquinolines with a structure of

Card 1/2

ACCESSION NR: AP4019020

Thus quinoline polymerization takes place with opening of the heterocycle. Similar to the case of pyridine, the operation is autocatalytic, i.e., it is stimulated by "seeding" the mass with a sample of already polymerized product. It is typical that the best results are obtained with a "seed" prepared at the same temperature as that of polymerization. The reaction is highly specific. Orig. art. has 1 figure, one formula, no tables.

TITLE: Synthesis of optically active polymers on the basis of propylenediamine and
cyclopropanedicarboxylic acid

SOURCE: Vyssokomolekulyarnyye soyedineniya, v. 6, no. 3, 1964, 512-515

TOPIC TAGS: polymer, optically active polymer, polyamide, cyclopropanedicarboxylic
acid, propylene-1,2-diamine, interfacial polycondensation, dichloride of cyclopro-
panedicarboxylic acid, turbidimetric titration

ABSTRACT: Synthesis of an optically active polymer from racemic components where
the rate of incorporation of the D or L forms into the macromolecule differed was
investigated. To 0.35 gm of racemic propylenediamine (in 400 ml water containing
0.8 gm KOH, at room temperature and under energetic stirring) were added dropwise
0.75 gm of the dichloride of trans-cyclopropanedicarboxylic-1,2 acid in 90 ml of
chloroform. After standing 30 minutes the polyamide was separated by filtration,
washed with 10% HCl and water, and purified by dissolution in 85% formic acid and

Cord 1/2

ACCESSION NR: AP4030371

subsequent precipitation with ammonia. The synthesis of a polyamide from L-propyl-enediamine was conducted in a similar way. From this polyamide the cyclopropane-dicarbonic acid component was recovered by hydrolysis with phosphoric acid, treatment with barium hydroxide, and passage through a column containing the cationic resin KU-2. The recovered acid was found to be optically inert, while the polyamide itself displayed an optical rotation of a sign opposite to that of the original L-propylenediamine (its optical rotation dispersion curve being normal). It was also observed that the melting point of the optically active polymer was 40 to 50 degrees higher than that of the racemic polyamide. Orig. art. has: 1 formula and 3 charts.

TITLE: The kinetics and mechanism of polymerization of aromatic heterocyclic compounds

SOURCE: Vysokomolekulyarnye soyedineniya, v. 6, no. 10, 1954.
1852-1861

TOPIC TAGS: aromatic heterocyclic compound, polymerization, quinoline, organic semiconductor, semiconductivity polymer, polyquino-
line, polypyridine

ABSTRACT: A study has been made of the kinetics and mechanism of polymerization of aromatic heterocyclic compounds as exemplified by quinoline and pyridine. A kinetic scheme has been proposed for autocatalytic polymerization taking into account the reversible formation of propagating radicals and the equilibrium in the system. Kinetic equations for polymerization equilibrium in agreement with the principal laws are devised which are in accordance with the principal laws.

Card 1/2

1 3

pyridine and quinoline polymerization in stoichiometric complexes with $ZnCl_2$. A polymerization mechanism is proposed for aromatic nitrogen-containing heterocyclic compounds, and the role of the complexing agents is discussed. By binding the unshared electron pair on the nitrogen atom, the complexing agent increases the polarization of the N-C bond in the ring and facilitates ring cleavage by a proton to form a conjugated carbonium ion. Propagation proceeds by the successive addition of monomer molecules to this ion. Orig. ext. 32 formulas, 1 table, and 4 figures.

TITLE: Role of "mobile prearrangements" in rapid polymerization below the monomer melting points

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 10, 1965, 1787-1791

TOPIC TAGS: polyacrylonitrile, crystallization, polymerization, copolymerization, polymerization kinetics, polymerization rate, copolymer

ABSTRACT: polymerization of acrylonitrile in the system inert diluent-acrylonitrile and copolymerization in the acrylonitrile-propionitrile system were investigated at temperatures below the monomer melting point to determine if diffusion migration of the monomer molecule is sufficient for rapid conversion to the polymer. Reactions were run at -196° using n-hexane or cyclohexane as inert diluents. The copolymeri-

Card 1/2

UDC: 66.095.26

Z

L 8859-66

ACC NR: AP5025965

zation product with propionitrile, regardless of initial monomer concentration, contained 57 mol% propionitrile, corresponding to its content in the eutectic phase. The most favorable conditions for rapid polymerization of monomers below their melting points occur at the instant when the mobility of the monomer molecule coincides with the ordering of the monomer molecules in the crystal, for instance, during phase transition in the solid polymer. This condition exists at the boundary of the crystals and the noncrystallized mass during the motion of the crystallization front. It is suggested that "mobile prearrangements" are formed momentarily on the crystal phase boundary; these are rapidly converted to polymer chains. Thus the polymerization front moves immediately behind the phase transition front. Orig. art. has: 3 figures and 2 tables.

TOPIC TAGS: equilibrium constant, polymerization equilibrium, depolymerization equilibrium, monomer, polymer, monophase system, equilibrium concentration, monomer molecule, macromolecule

ABSTRACT: PDE (polymerization-depolymerization equilibrium) sets in owing to the reversibility of the chain-growth reaction. Generally PDE is described by the combined whole of the equilibria in reversible elementary reactions of the addition of a molecule of a monomer to active polymer chains. The equilibrium constant of the PDE is dependent on the equilibrium concentration of the monomer and is not directly dependent on the concentration of monomer in the system. The presence of monomer particles in a system affects only the thermodynamic activity of the monomer. Since the PDE consists

Card 1/2

L 35148-65

ACCESSION NR: AP5006857

mized only by the activity of the monomer, the chemical potential of the polymer is independent of its concentration in the reaction medium. In other words, even when a polymer is soluble in a reaction system, the PDE is described as heterogeneous. Thermodynamically it is completely analogous to the equilibrium in a monocomponent liquid \rightleftharpoons vapor system. This means that, when analyzing the PDE at the level of monomer molecules and polymer-chain links, the individual macromolecule may be considered as a tiny crystal or a drop of liquid suspended in a reaction medium, i.e. as an individual phase (art.).

TITLE: Polymerization of 4-vinylpyridine in polystyrole sulfonic acid

SOURCE: AN SSSR. Doklady, v. 161, no. 5, 1965, 1131-1134, and insert facing p. 1119

TOPIC TAGS: polymerization, polystyrole, pyridine, IR spectrum, electron microscope

ABSTRACT: The results are given of studies of the reaction of 4-vinylpyridine with a strong polymeric acid: polystyrole sulfonic acid. The acid was obtained by radiation polymerization of styrole sulfonic acid. It was found that addition of a 30% solution of polystyrole sulfonic acid in methanol to 4-vinylpyridine (molar ratio of the latter to the acid of 10:1) leads to immediate precipitation of readily solidifying sediment. The IR spectrum of the resulting product was compared with the spectra for vinylpyridine and poly-4-vinylpyridine. The band at 926 cm^{-1} , belonging to deformational vibration of C-H in the vinyl group and being present in the spectrum for 4-vinylpyridine, was absent in all the

Card 1/2

L 53901-65

ACCESSION #: AP5011539

compared spectra. This indicates polymerization in the reaction. Elemental analysis of the reaction product shows 4.65% and 10.0% carbon and 11.07%, respectively, from the literature values.

..... in the polymerization product formed with pyrostyrole sulfonic acid. The latter is a selective polymeric activator in this reaction. By means of electron and polarizing microscopes, spiral growths were observed in the polymeric forms. It is concluded that these are due to internal stresses arising through redistribution of interatomic distances during growth of macromolecules from monomer molecules chemisorbed on the polystyrole sulfonic acid. "In conclusion, the authors express their thanks to the workers at M. M. Kusakov's laboratory for recording the IR spectra." TOPIC TAGS: polymerization, thermodynamics, chemical reaction kinetics, reaction mechanism, polymer structure

ABSTRACT: Based on literature data and the author's recent research on stereospecific polymerization, a new fundamental approach to the problem of controlling the rate and selectivity of chemical reactions has been formulated. This approach involves the creation of a strong intermolecular interaction by introduction of a new component (such as a complex-forming agent) or induction of morphological changes (e.g., crystallization) in the reaction system. When applied to polymerization, either means is potentially useful for controlling the mechanism and kinetics of the reaction, and the structure and morphology of the polymer products. Monomer complex formation, in addition, can also affect the thermodynamics of the polymerization. A particular case of monomer complex formation has biochemical implications. Orig. art. has:

TITLE: Mechanism of polymerization of 4-vinylpyridine on macromolecular "matrices"

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 9, no. 2, 1967, 340-344

TOPIC TAGS: polymerization rate, vinyl compound, pyridine, sulfonic acid

ABSTRACT: Viscometry and UV spectroscopy were used to study the polymerization rate v_{pol} of 4-vinylpyridine (VP) in aqueous solutions of polystyrenesulfonic acid (PSSA) and polyethenesulfonic acid (PESA), both of which served as the matrices; v_{pol} was studied as a function of the degree of neutralization of the polymeric acids α . It is shown that v_{pol} increases sharply as α approaches unity. On the basis of the established kinetic dependence of v_{pol} on α , two possible mechanisms of polymerization of VP on PSSA and PESA are considered. Both mechanisms follow from concepts according to which there is either a possibility of a rigid fixing of VP molecules on the polymeric acids, or the presence of a sufficient mobility of VP molecules to allow migration along the chain of the macromolecular acid. The mechanism based on the second of these concepts is confirmed experimentally. Orig. art. has: 2 figures and 13 formulas.

ORIG. PUB. : Svinovodstvo, 1957, No 10, 15-16
ABSTRACT : Beginning in 1956, pigs of the large white and the Kalikinskaya breeds were crossed at the Beresovskiy MTS' Kolkhozes of the Lipetskaya oblast'. The hybrids which were thus derived contain the best qualities of both breeds in terms of body build and constitutional type. At the age of 6-7 months castrated animals reach a live weight of 90-100 kg. In all animals which were turned in to the government, feed expenditure amounted to 4.8 feed units per 1 kg of weight gain.

TITLE: The Concentration of the Abakan Ores (Obogashcheniye Abakanskikh rud)

PERIODICAL: Gornyy zhurnal, 1958, Nr 11, pp 68 - 72 (USSR)

ABSTRACT: The iron ore produced from the Abakan deposit is first processed at the Abakanskaya drobil'no-obogatitel'naya fabrika (Abakan Crushing-Concentrating Mill) where the large tailings are separated, and the intermediate product is sent to the Abagurskaya obogatitel'naya fabrika (Abagur Concentration Mill). The yearly output of the Abakan mill is 1,500,000 tons and will be increased to 2,500,000 tons. The output of the Abagur mill is about 3,000 tons a day. Production at both of these mills is below the planned quantities, mainly because the upper layers of the Abakan deposit are poorer in iron content than was expected. Different technical and economical indicators of work in both mills are shown in tables 1-4. There are 2 schematic diagrams and 4 tables.

Abstract : The results of the tests carried out on the crossbred horses of the Russian Heavy-Draft breed at the Chernushensk State Thoroughbred Breeding Station showed that crossbred horses possess high efficiency and may be used for general duty. At 2½ years of age, they covered 2 km. at a trot with a traction force of 25 kg. in 7 min. 48 sec.; at a pace, with a traction force of 70 kg.,

TITLE: Experimental Investigation of Bending of a Cantilever (Circular) Cylindrical Shell with a Large Rectangular Cut-Out when Loaded by a Concentrated Force at the Free End (Eksperimental'noye issledovaniye karkasirovannoy krugovoy tsilindricheskoy obolochki s bol'shim pryamougol'nym vrezom pri izgibe sosredotochennoy siloy)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Aviatsionnaya tekhnika, 1959, Nr 2, pp 49-61 (USSR)

ABSTRACT: The experiments were carried out on a shell of 600 mm diameter, 3800 mm long, plated with D16AT of 0.8 mm thickness. The shell was stiffened on the outside by longitudinal stringers (pressed dural angles, Pr 100-3, of a cross-sectional area of 0.434 cm^2) and on the inside by ribs spaced at 130 mm. The total length of the cut-out was 1000 mm. The general lay-out of the shell is shown in Fig 1, while Fig 2 shows the cross-section of the rib. Along their whole length the longitudinal edges of the cut-out were reinforced by either channels with flat fillets or

Card 1/5

SOV/147-59-2-7/20

Experimental Investigation of Bending of a Cantilever (Circular) Cylindrical Shell with a Large Rectangular Cut-Out when Loaded by a Concentrated Force at the Free End

simply by flats, as shown in Fig 3. In the plane of symmetry of the shell (i.e. with respect to cut-out) two longitudinal joints were made. One end of the shell was firmly fixed (by means of a fitting attached to a steel plate) and the shell was loaded at the other (free) end, the force being applied with the aid of cables to a short steel cylinder which was fitted into the shell (see Fig 1). The force was measured by a spring dynamometer. Two different directions of loading were used, as shown in Fig 4. In the first case the force vector was in the plane of symmetry of the structure and in the second case, in the axial plane perpendicular to the plane of symmetry. Fig 5 shows the complete rig ready for experiments. The results of experiments are presented in Figures 7 to 14. The graphs also include the theoretical curves obtained from relations developed in Ref 1. All experimental data and the computational values refer to the same loading, viz 1000 kg. Figures 7 to 10

Card 2/5

SOV/147-59-2-7/20

Experimental Investigation of Bending of a Cantilever (Circular) Cylindrical Shell with a Large Rectangular Cut-Out when Loaded by a Concentrated Force at the Free End

refer to the symmetric loading (case 1) and Figures 11 to 14 refer to the asymmetric loading (case 2) as follows: Fig 7 shows the tangential stresses in the open portion of the shell (at sections 1 and 4, see Fig 1). It is seen that they do not remain constant and are greatest between the 8th and 9th stringers. It also appears that the strength of the longitudinal reinforcement on the edges of the cut-out has essentially only a local effect on the magnitude of stresses in the panel at the boundary of the cut-out. There is good agreement between the calculated and the experimental results. From Fig 8, which refers to sections 5 and 7, it is seen that in the closed portion of the shell the distribution of tangential stresses is extremely non-uniform, showing even local concentration of stresses. The peaks in the stress curves become less sharp further away from the cut-out.

Card 3/5

SOV/147-59-2-7/20

Experimental Investigation of Bending of a Cantilever (Circular) Cylindrical Shell with a Large Rectangular Cut-Out when Loaded by a Concentrated Force at the Free End

The strength of the reinforcement on the edges of the cut-out has an insignificant influence on the distribution of the tangential stresses. Fig 9 shows the normal stresses at sections 1, 4 and 5; while in Fig 10 the normal stress along the stringers Nr 1 and Nr 9 are shown, the last one being the reinforcement of the cut-out edge. Again there is good agreement between the experiment and the theory of Ref 1. For the case of the asymmetric loading the conclusions may be summarised as follows: The distribution of tangential stresses in the open part of the shell (Fig 11 refers to sections 1 and 4) again is not constant. The strength of the reinforcement on the cut-out edge again has only a local effect, influencing the stresses in the panel between the 8th and 9th stringers. Agreement between the experiment and the theory of Ref 1 is much poorer than in the previous case. In the closed part of the shell the distribution of tangential stresses is also non-uniform (Fig 12, sections 5 and 7).

Card 4/5

SOV/147-59-2-7/20

Experimental Investigation of Bending of a Cantilever (Circular) Cylindrical Shell with a Large Rectangular Cut-Out when Loaded by a Concentrated Force at the Free End

The non-uniformity becomes less intense further away from the cut-out into the closed part of the shell. The strength of the reinforcement has fundamentally a local effect influencing only the maximum stress arising in the panel between the 9th and 10th stringers. Agreement between the calculated normal stresses and the experimental values (Fig 13) is good at Section 1 (at the middle of the cut-out) but poor at the boundary of the cut-out (section 4). Fig 14 represents the distribution of normal stresses in the stringers Nr 9 and Nr 5. There are 14 figures and 1 Soviet reference.

TITLE: Stability of a circular cylindrical shell subjected to nonuniform temperature distribution

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy,
Aviatsionnaya tekhnika, no.2, 1962, 65-71

TEXT: It is assumed that the shell (Fig.1) is subjected to longitudinal forces of magnitude

$$T_1 = - T \cdot f(\varphi) \quad (1)$$

where: T - parameter, $f(\varphi)$ - arbitrary even function of the coordinate φ . Equilibrium conditions are expressed by:

$$D \nabla^2 \nabla^2 W - \frac{1}{R} \cdot \frac{\partial^2 F}{\partial x^2} = T_1 \cdot \frac{\partial^2 W}{\partial x^2},$$

$$R \cdot \nabla^2 \nabla^2 F = - Eh \cdot \frac{\partial^2 W}{\partial x^2} \quad (2)$$

Card 1/3

S/147/62/000/002/009/020
E201/E135.

from which the equation of forces is obtained for a cylinder partially filled with liquid at zero temperature and placed in a medium at the temperature T^* :

$$T_1 = - E h \alpha T^* \cdot [\delta(\varphi) - (1/\pi)(\beta + 2 \sin \beta \cdot \cos \varphi)] \quad (19)$$

The maximum value of T_1 is reached when $\varphi = \beta$:

$$T_{1 \max} = - k_2 [\pi \cdot \delta(\varphi) - \beta - \sin 2\beta] \cdot T_c \quad (22)$$

Fig.3 shows values of q (continuous lines) and corresponding values of k_2 . $q = \pi R / \ell$, ℓ = length of longitudinal half wavelength. It can be seen that the longitudinal waves are short. Assuming that $q^2 \gg n^2$, a_n can be considered independent of n ; the critical temperature is proportional to σ_n :

$$q \approx q_1 \quad (23)$$

where q_1 is given by:

$$q_1 = (R/h) \cdot \sqrt{l^2 (1 - v^2)} \quad (24)$$

Card 2/ ~~2~~ 3

Stability of a circular

S/147/62/000/002/009/020
E201/E135

When $\alpha_n = 1$, k_2 is independent of h/R and the critical temperature is proportional to h/R . In this case the critical stress is equal to the critical stress in the cylinder when it is subjected to uniform axial compression. There are 5 figures.

SOURCE: AN UkrSSR. Institut mehaniki. Teplovye napryazheniya v elementakh konstruktsiy; nauchnoye soveshchaniye. Doklady*, no. 3, 1963, 201-210

TOPIC TAGS: thermal stress, cylindrical shell, circular cylindrical shell, cylindrical shell stability, nonuniform heating, aircraft design

ABSTRACT: Investigation of shell stability during uneven heating and the problems connected with it are especially important in aircraft construction. The basic question is to what degree the heterogeneity of the stress exceeds the critical value of the amplitude T as compared with the magnitude of critical stress at uniform compression. $T_1 = Tf(\phi)$, where T is the stress amplitude and $f(\phi)$ is an arbitrary even function. In the case of bending of the shell by momentum, W. Flugge obtained an amplitude of critical stress equal to 1.33 times the value of critical stress at a uniform compression. Later investigations by Yu. G. Odinokov, Ye. D. Pletnikova, and P. Seide indicated that for thin-walled shells the amplitude of critical stress during bending (within the limits of the linear theory of stability) differs very little from the critical stress at uniform com-

1/3

Card

ACCESSION NR.: AT4010248

pression. Flugge's results can be explained by the fact that the wavelength in the longitudinal direction, as accepted by him, does not correspond to the minimum critical stress. The problem of thermal buckling of circular cylindrical shells was also considered by D. Abir and C. Nardo, and the work of P. P. Bijlard is analyzed by the author. The case of the stability of a partially filled and immersed shell, with the temperature of the liquid 0° and the temperature of the surrounding medium T° , is given as an example. The conclusion is that, according to the linear theory of stability of thin walled shells, the uneven distribution of stresses in cross-section has little influence on the critical value of the largest compressing stress. For the definition of critical temperature, the author gives the following formulas:

$$T^\circ = k_2 T^\circ_c, \text{ where } T^\circ \text{ is the temperature amplitude, where}$$

$$k_2 = \frac{1}{\lambda} \text{ and } T^\circ_c = \frac{\pi}{\sqrt{3(1-\nu^2)}} \frac{h}{R}, \text{ where } h \text{ and } R \text{ are the thickness and radius of the shell. Finally, } k_2 = 1/(\gamma - \beta - \sin 2\beta).$$

TITLE: Stability of an anisotropic circular-cylindrical shell under combined external pressure and axial forces

SOURCE: IVUZ. Aviatsionnaya tekhnika, no. 4, 1964, 46-51

TOPIC TAGS: shell buckling, shell stability, cylindrical shell, anisotropic shell, isotropic shell, orthotropic shell, constructionally orthotropic shell

ABSTRACT: The buckling of a circular-cylindrical anisotropic shell of medium length is analyzed in linear formulation. The faces of the shell are straight segments, which are rigid in their planes, and it is stable under combined external compressive forces. A Kh. M. Mushtari stability equation is used to derive exact expressions from which the minimum buckling load and other parameters can be determined. Approximate expressions describing the effect of tensile and compressive axial forces on wave forming is discussed. Results of a numerical calculation of critical loading for certain geometrical and

TITLE: Stability of a circular cylindrical sandwich shell.

SOURCE: AN SSSR. Izvestiya. Mekhanika i massivnostroyeniya. No. 1, 1964, 116-119

TOPIC TAGS: cylindrical shell, shell stability, shell buckling, compressed cylindrical shell, sandwich shell, sandwich shell buckling, symmetrical sandwich.

ABSTRACT: Local buckling of a circular cylindrical sandwich shell of symmetric (geometrically and physically) construction is analyzed.

The layers are isotropic and possess a finite flexural rigidity. The outer layer is compressive, the inner layer is compressive-compressive.

The buckling problem is solved by the finite difference method.

L 9040-65
ACCESSION NR: AP4043893

The thickness is assumed valid for the core. Poisson's ratio is taken as the same for all layers. The shell is acted upon by a force which is constant over its length and varies sinusoidally circumferentially. The stability equation is derived. A linearized form is used as the initial one. Through application of the Galerkin method, a system of linear homogeneous algebraic equations in matrix form is obtained. The problem of determining the buckling-force parameter is thus reduced to finding the maximum eigenvalue of the matrix; the eigenvector will determine deflection. Application of the finite-difference method is illustrated to analyze the effect of the stability parameters of the core and faces on the share of the resistance to compression and the effect of the non-uniformity in external-force distribution on the analysis. Effects of the buckling parameter on discusssed at length. Relationships between the buckling parameters and scaling force are shown in diagrams. Title, Art. List, 4 figures, and 2 tables.

TITLE: Buckling of an anisotropic circular cylindrical shell under tension, internal pressure, and longitudinally nonuniform heating

SOURCE: Nauchnoye soveshchaniye po teoriyam napryazheniy v zadaniyakh i zadaniyakh po napryazheniyam elementov konstruktsii. 1981. 4. 1. - 4. 4. 1981. Drukad' soveshchaniya, No. 4, Kiev, Naukova Dumka, 1984-167

TOPIC TAGS: cylindrical shell, ²⁴ circular cylindrical shell, anisotropic cylindrical shell, shell buckling, thermal shell buckling, nonuniformly heated shell

ABSTRACT: The linear stability problem of a constructionally anisotropic circular cylindrical shell of medium length, stiffened by identical longitudinal and transverse systems, and clamped at both faces against rigid diaphragms is analyzed. A constant axial force and longitudinal, variable hoop forces, either compressive or tensile, act on the middle surface of the shell. Special attention is paid to the effect of the nonuniformity of the hoop force on its critical value; the buckling behavior of a shell subjected only to hoop forces is investigated. The

Card 1/2

results obtained are applied to examining the stability of a shell under combined with internal pressure and a temperature jump in the longitudinal axis (vertical hollow cylinder in a hot medium, the cylinder being partly filled with a zero-temperature liquid); the physical constants of the shell material are assumed to be independent of the temperature. The thermal stress distribution in the central part of the shell is analyzed without taking account of the edge effect. The conditions along the longitudinal axis are taken as the boundary conditions, and an expression for the temperature of buckling is derived. The effect of thermal stresses on the critical axial compression force is determined. Results of numerical stress analysis of strongly stiffened, weakly stiffened, and plain shells are briefly discussed. Orig. art. has: 4 figures and 32 formulas.

TITLE: The action of edge effect on the stability and strength of a structurally anisotropic circular cylindrical shell under compression, internal pressure and heating

SOURCE: IVUZ. Aviatsionnaya tekhnika, no. 1, 1966, 54-62

TOPIC TAGS: edge effect, cylindrical shelf structure, compressive stress, temperature stress

ABSTRACT: The author studies a uniformly heated circular cylindrical shell with a dense network of longitudinal and transverse reinforcements under the effects of an axial linear compression load N and internal pressure p (see figure). This shell has

Cord 1/2

UDC: 539.3 + 629. 013. 012

L 39792-66

ACC NR: AP6011785

elastic support ribs along its edges. The temperature of the shell is t , while that of the support ribs is t_r . The physical constants of the shell material, the reinforcements and supports are identical and are independent of temperature. The effect which local deformations originating at the supports have on the strength and stability of the shell is considered. The deformations are divided into axisymmetric and nonaxisymmetric. An analysis indicates that edge effect occurs even in the absence of temperature and pressure. Stress intensity may be several times greater than momentless state intensity. The maximum intensity is at the supports for a clamped shell and near the supports for a supported shell. If the temperatures of the supports and the shell are at great variance, the temperature stresses significantly increase stress intensity. Nonlinearity in the edge effect is significant when N is large. As N approaches the critical value, qualitative and quantitative changes occur in the stress pattern. The functions describing nonlinear edge effect are periodic and greatly different from the nonperiodic functions for linear edge effect. Reinforcement reduces nonlinear effects. ABSTRACT: This Author Certificate presents a mass flow meter gauge containing two impellers with differing blade pitches, interconnected by an elastic element in the form of a torsion device (see Fig. 1). To increase the accuracy of measurement, one end of the torsion device is rigidly fastened to the impeller shaft and the other end is rigidly fastened to a part movable along the axle. The part is mounted between two elastic elements, e.g., springs, whose stiffness is less than that of the torsion device.

TOPIC TAGS: cylindric shell, ^{structure} circular cylindric shell, shell buckling, thermal buckling, axially compressed shell, plastic buckling, plastic shell buckling

ABSTRACT: The buckling behavior of a thin circular cylindrical shell of medium length stiffened by closely spaced stringers, and having rigid diaphragms at ends is discussed. The temperatures of the skin and the stringers are different. The states of stress and strain in the skin and the stringers are analyzed by using the strain theory supplemented by an assumption that there are no unloaded areas in the structure. The shell is treated as an orthotropically stiffened one under the conventional assumption of the thin-shell theory. Expressions for determining the stresses in the skin and the stringers are derived, and a graphico-analytic method

Card 1/2

L 04569-67

ACC APPROVED FOR RELEASE: 07/19/2001 CIA-RDP86-00513R000519810004-3

of their solution is outlined. The static-stability criterion is used in investigating the buckling of the shell, assuming the membrane-stress state prior to buckling and an instantaneous transition to the buckling state under constant (prebuckling) external forces and temperatures. Expressions for forces and moments acting in the state of postbuckling equilibrium are given as well as the equation of its stability from which a formula for determining the critical force is derived for cases of symmetrical and asymmetrical buckling. The modes of buckling and the range of applicability of derived formulas are analyzed and a practical formula for calculating the buckling force is given. The graphico-analytical procedure to be used in calculating is outlined and is illustrated by a numerical sample calculation which shows in an accompanying diagram the unfavorable effect of thermal stresses on the stability of a stringer-stiffened cylindrical shell. Orig. art. has: 4 figures, 27 formulas, and 1 table.
