On the Correlation Functions for Systems of Equal Charged  
Particles (O korrelyatsionnykh funktsiyakh dlya sistemy  
odinakovyykh zaryazhennykh chashts)

PERIODICAL:

Doklady Akademii nauk SSSR, 1958, Vol 123, Nr 6, pp 999-1002  
(USSR)

ABSTRACT:

In the present paper, the correlation functions for charged particles (in the inhomogeneous case) are constructed according to the method of iterations which permits the calculating of corrections of any order of approximation. The authors investigate also the physical significance of this method. The potential energy of the particle in the self-consisting field is introduced into the equations of this problem. The authors investigate the interaction of a pair of charged particles which are placed in a "medium" of particles of the same kind. At small mutual distances this interaction satisfies the Coulomb (Kulon) law, but at great distances the Coulomb interaction is shielded by the "medium", and the interaction is due to the self-consisting field. In first approximation it is possible to

Card 1/3

On the Correlation Functions for Systems of  
Equal Charged Particles

SOT/20-123-6-12/50

neglect the correlation of the medium with the first particle. A formal expansion is not advantageous, and the authors apply the method of iterations. According to this method, it is possible to find all the k-particle potentials with any desired degree of exactness. The explicit calculations are, however, very complicated and not interesting from the viewpoint of physics. The authors then give a formula for the potential energy of the interaction of a subsystem which consists of s charged particles. This formula represents the sum of the energy of interaction of each particle with the "medium", of the energies of the shielded (by the medium) interaction of all the pairs, of all the triplets, ..., of all the sets of s particles. The interaction with the self-consisting field and the Debye (Debye) pair interaction play the main rôle. The other terms in the above-mentioned formula are of higher order of smallness. According to the results of the present paper, effective-short-range forces (which can be described by a Debye potential) can be introduced. In the inhomogeneous case, the expressions found for the correlation functions are valid for functions which occupy a finite volume.

TITLE: Stability limits of the superconducting state in a magnetic field for superconductors of the second kind			
SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 50, no. 3, 1966, 717-723			
TOPIC TAGS: superconductivity, superconductor, BCS theory, critical temperature, magnetic field			
ABSTRACT: The Gibbs free energy function $\Omega\{\Delta\}$ for a <u>superconductor in a magnetic field</u> is treated on the basis of the BCS theory as a functional of the superconducting ordering parameter. This extends the corresponding expression of the Ginzburg—Landau theory to arbitrary temperatures. The free energy is minimum at equilibrium. This yields equilibrium electrodynamic equations, which in the case of superconductors of the second kind describe the usual superconducting state with finite penetration of the field, as well as the mixed Abrikosov

state with vortex lines which permeate the massive superconductor. The second variation of the free energy is investigated in the vicinity of the superconducting state, and it is shown that the state is stable with respect to small fluctuations of the ordering parameter up to a certain critical field  $H_{c1} > H_{c1''}$ , for which  $\delta^2 \Omega$  changes sign for the first time. The field strength  $H_{c1}'(T)$  is calculated for extremely hard superconductors. ( $\kappa \gg 1$ ). [CS].

TITLE: Motion of vortex filaments in superconducting alloys

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniya, v. 3, no. 3, 1966, 121-125

TOPIC TAGS: superconductivity, quantum liquid, crystal lattice structure, crystal dislocation phenomenon

ABSTRACT: Since it is difficult to apply the ordinary hydrodynamic approach to the motion of vortex filaments in superconductors of type II, owing to the presence of the lattice, the author shows that, in view of the Coulomb interaction and in view of the field character of the vortex, it is sufficient for the solution of the problem to find directly the response of the superconducting system to an external field. Relations are then presented which constitute, together with Maxwell's equations and the continuity equation, a complete system that yields the vortex equation of motion. These relations are derived from the general principles of nonequilibrium thermodynamics by expressing the work performed on the system by the external cur-

TITLE: Formation of vortex nuclei in superconductors of the second type

SOURCE: Zh eksper i teor fiz, v. 50, no. 5, 1966, 1322-1326

TOPIC TAGS: vortex flow, magnetic field intensity, nuclear energy, superconductor,  
*superconductivity*

ABSTRACT: Because the superconductivity state is stable under small fluctuations of the regulating parameter, sufficiently large fluctuations are needed to effect transitions to the mixed state in superconductors of the second type in a magnetic field. The vortex lines are produced near the surface and penetrate into the superconductor. The minimum critical size of the vortex nucleus is that at which it does not "close up" but continues to develop further. It has been shown that the shape of the vortex line and the value of the energy barrier for the nucleus is determined.

Card 1/2

L43093-66

by two factors: the interaction between the vortex and magnetic field and the elasticity of the vortex line. The vortex line forms a semicircle, the end of which touch the surface of the superconductor. The value of the energy barrier, overcome during formation of the vortex, has been calculated. It has been shown that the barrier vanishes in a critical current on the surface, i. e., when the superconducting state becomes unstable under small fluctuations. The author thanks I. M. Lifshits for his criticism of the work and valuable remarks. Orig. art. has; 1 figure and 5 formulas. [Based on author's abstract] [NT]

TITLE: Local equations of electrodynamics for London-type superconductors

SOURCE: Fizika metallov i metallovedeniye, v. 21, no. 4, 1966, 496-509

TOPIC TAGS: superconductivity, quantum electrodynamics, vortex

ABSTRACT: In a maximally hard superconductor, the structure of the vortex filaments in the hybrid state does not play any substantial part at fields which are not too close to  $H_{c2}$ . This confirms the possibility of using local equations of electrodynamics for describing such superconductors. The article shows by means of direct calculations that the indicated equations in the first nonvanishing approximation in terms of parameter  $1/\chi$  coincide with equations of the two-liquid model in the theory of superconductivity. These equations are used to analyze the problem of penetration of a magnetic field into a massive superconductor. The critical field  $H_{c1}$  up to which the superconducting state is stable with respect to slight gap fluctuations leading to the formation of vortices was calculated (the gap being the ordering parameter  $\Delta$ ). The manner in which the hybrid state is described by these equations is discussed. Author is indebted to I. M. Lifshitz for many helpful discussions and is deeply grateful to J. Bardeen (USA) for elucidating the fundamental aspects of the general problem of local

Warsaw, ~~Zeszyt Epidemiologiczny~~, Vol XVI, No 4, 1962,  
pp 431-442

*Abstract: (Authors' English summary modified)* The need for immunization against diphtheria is discussed. Children aged 7 to 14 were immunized with two aluminum hydroxide adsorbed vaccines mixed with tetanus toxoid. The two vaccines had amounts of diphtheria toxoid varying by a factor of 10 per dose. Post-vaccination reaction and immunogenic response were tested. The vaccine containing 20Lf per dose produced more post-vaccination reactions as compared with the vaccine

Warsaw, Przeglad Epidemiologiczny, Vol XVI, No 4, 1962  
pp 431-442 (continued)

with only 2Lf per dose. This difference is statistically significant. Both vaccines produced good immunogenic response after the booster dose; the vaccine containing Leva diphtheria toxoid did not produce satisfactory response in school-age children. The antibody level after immunization rose logarithmically, as a function of the initial level before immunization. The occurrence of post-vaccination reactions as a function of antibody level before immunization is analysed and discussed. Recommendations on further studies and practices are made. 9 tables; 15 references, mainly Western.

TITLE: Electrical and photomagnetic properties of single crystals of the  $Cd_xHg_{1-x}Te$

SOURCE: Przeglad elektroniki, no. 3, 1966, 111-117

TOPIC TAGS: single crystal, crystal property, semiconductor crystal, electric property,  
photomagnetic effect

ABSTRACT: The paper presents some results of investigations on the  $Cd_xHg_{1-x}Te$  system. Single crystals of  $x = 0.00, 0.05, 0.10$ , and  $0.15$  were used for the investigations. The dependence of electrical conductivity  $\delta$  and the Hall constant  $R_H$  on temperature in the range from  $4.2K$  to  $400K$  was investigated. The dependence of  $R_H$  and  $\delta$  on magnetic field intensity was also measured. The materials investigated show a high electron mobility; the maximal values of electron mobilities are of the order of  $10^5 \text{ cm}^2/\text{Vsec}$ . Mobility increases with increasing  $x$  and attains its maximum values for  $x$  at about  $0.1$ . In these materials, at temperatures below room temperature there is a very strong dependence of  $R_H$  and  $\delta$  on magnetic field intensity. It was determined that for  $x = 0.00$  the width of the forbidden energy gap at the temperature of absolute zero is  $E_g = 0 \pm 0.0003 \text{ eV}$ . For  $x > 0$ ,  $E_g > 0$ , and  $x = 0.05$  it is  $E_g = 0.015 \text{ eV}$ .

L 31539-66

ACC NR: AP6010792

and for  $x = 0.15$ ,  $E_g = 0.06$  eV. The photomagnetic effect was investigated at room temperature. High sensitivity to infrared radiation was established. The material with  $x = 0.10$  is sensitive to radiation from the visible range to wavelength of 10 microns. It was also established that the photomagnetic effect for  $x = 0.10$  depends on the frequency of incident radiation. This dependence is caused by the appearance of a thermal component (Nernst effect). The experimental results are presented in the form of curves and compared with published data. The results are discussed in detail in the light of existing literature. The authors thank Prof. L. Sosnowski for his interest in this work and discussions. The authors also thank Docent Dr. W. Wardzynski, J. Ginter, Dr. J. Mycielski, and Dr. J. Rauluszkiewicz for valuable comments they made in the course of this investigation. Orig. art. has: 7 figures.

AUTHOR: Galazka, R. R.

TITLE: Preparation, doping and electrical properties of Cd sub 0.1 Hg sub 0.9 Te

SOURCE: Acta physica polonica, v. 24, no. 6, 1963, 791-800

TOPIC TAGS: semiconductor, three-component semiconductor, Hall mobility, solid state physics, three-component semiconductor, Hall mobility, solid state physics, three-component crystal, crystallography, Cd sub x Hg sub 1 - x Te-type semiconductor, compound semiconductor, HgTe, CdTe

ABSTRACT: Mixed crystals of the  $\text{Cd}_x\text{Hg}_{1-x}\text{Te}$  type are an insufficiently studied group of semiconductors. The technology of  $\text{Cd}_x\text{Hg}_{1-x}\text{Te}$  compounds has not been adequately analyzed or described up to the present time. Author attempted to establish the optimal processes for the synthesis and crystallization of HgTe and CdTe which leads to a mixed semiconductor. The effect of excess Cd, Te and Hg upon the electrical properties of  $\text{Cd}_{0.1}\text{Hg}_{0.9}\text{Te}$  was also investigated.

Card 1/3

ACCESSION NR: AP4011794

An attempt was also made as to which foreign elements dope the conductor to p- and n-types. The effect of variegated processing and doping upon the purity and electrical properties of the sample was analyzed by measuring the Hall coefficient and electrical conductivity versus the temperature over the range 77k to 300k. Doping was with Cu, In, Al and Ni. The composition of the compound (the value for x) was determined by measuring its density. In the case of  $A_xB_{1-x}$  type solid solutions crystallizing in one phase and in the same crystallographic system, the density of a solution containing x moles of component A can be written in the form

$$d_x = \frac{x \sum_{i=1}^n M_{Ai} + (1-x) \sum_{i=1}^n M_{Bi}}{V_{ex}} = \frac{n[x(M_A - M_B) + M_B]}{V_{ex}} \quad (1)$$

where  $V_{ex}$  is the volume of the elementary cell of the solid solution;  $M_A$  and  $M_B$  are the atomic masses of the lattice modes (or their molecular masses if A and B are chemical compounds); n is the number of modes belonging to one and the same elementary cell (or the number of molecules of a given compound per one elementary cell). The density varies linearly with the composition.

Card 2/3

ACCESSION NR: AP4011794

The Te atoms probably take up the Hg positions, yielding down levels. Hg dopes the semiconductor to p-type. Excess of Cd produces no noticeable change. Hole mobility was estimated at  $\mu_p = 420 \text{ cm}^2/\text{voltsecond}$ . Material was obtained wherein the value of the product of the Hall coefficient ( $R$ ) and conductivity ( $\sigma$ ) amounted to  $4 \times 10^5 \text{ cm}^2/\text{voltsecond}$  at 200k. Although the above analysis dealt with a  $\text{Cd}_{0.1}\text{Hg}_{0.9}\text{Te}$  semiconductor, the conclusions and discussions can be valid for other semiconductor of the type  $\text{Cd}_x\text{Hg}_{1-x}\text{Te}$ , especially in the region of small values for the parameter  $x$ . "The author wishes to thank Professor L. Sosnowski for his numerous and helpful remarks. The author is indebted to Dr. W. Giriak and Mrs. W. Szymanska, m. Sci., for their profound and detailed discussions of the problem." Orig. art. has: 7 figures, 2 equations and 1 table.

TITLE: Determination of the effective mass in n-type InSb by means of magnetoplasma reflection

SOURCE: Physica status solidi, v. 6, no. 2, 1964, 549-554

TOPIC TAGS: magnetoplasma reflection, refractive index, intraband transition, semiconductor, degenerate semiconductor, spherical energy band, nonparabolic energy band, plasma reflection, carrier concentration, indium antimonide, magnetoplasma

ABSTRACT: The refractive index for intraband transitions in degenerate semiconductors in the presence of a magnetic field has been calculated for spherical and nonparabolic energy bands. The results have been used for describing the plasma and magnetoplasma reflections, and for determining the effective mass of carriers in heavily doped InSb. Plasma and magnetoplasma reflections are observed in n-type InSb with carrier concentrations of  $10^{18}$  to  $10^{19} \text{ cm}^{-3}$ . The values of the effective mass of the electrons confirm Kame's band struc-

Card

ture to concentrations exceeding  $10^{19} \text{ cm}^{-3}$ . In the absence of a magnetic field the reflectivity dropped to a minimum at the frequency  $\omega_{\min}$  and then rose to high values for  $\omega < \omega_{\min}$ . In the presence of a magnetic field the reflectivity was distinctly split, and the distance between the two minima depended on the magnetic field. The effective mass was estimated at a lattice dielectric constant  $\epsilon = 15.4$ , and the concentration of current carriers was calculated from the position of the minimum of reflectivity in the absence of a magnetic field using the evaluated effective mass. The results are presented in tabular form in the original article. "The authors thank Prof. Dr. I. Sosnowski and Dr. J. Kolodziejczak." Orig. art. has: 3 figures, 16 formulas, and 1 table.

TITLE: Infrared radiation detectors

SOURCE: Postepy fizyki, v. 15, no. 2, 1964, 191-211

TOPIC TAGS: infrared radiation detector, thermal detector, thermocouple, photoelectric cell, semiconductor infrared detector, photoelectric infrared detector, photoconductivity, Johnson noise, photoelectromagnetic effect, Nernst photoelectromagnetic effect, infrared photodetector

ABSTRACT: The subject of the article is the problem of detection of infrared radiation and a description of some types of detectors. From the standpoint of their mechanism of operation, such detectors may be divided into two principal categories: (1) thermal detectors, operating on the principle of change in the physical properties of a body subjected to the heat of infrared rays, and (2) quantum or photon detectors, which utilize various types of photo-effects and directly related phenomena. All types of detectors have a common parameter, the minimum detectable power (MDP). The article discusses semicon-

Card 1/2

ACCESSION NR: AP4039358

ductor infrared detectors operating in the spectral range of 3 to 20 microns, and thermal detectors, which are sensitive over a much wider range. The discussion was limited to the 3-20  $\mu$  range because the semiconductor detectors operating in this range are comparatively unknown, and only InSb detectors which have an upper limit of 6.5  $\mu$  are used in practical technical applications. Theoretical calculations are given for photon detectors. Photoelectric cells are found to be much more convenient than thermocouples. Investigations of photoelectric effects in compounds of Cd and Hg show that these materials are eminently suitable for infrared detection. Orig. art. has: 12 figures, 39 formulas, and 5 tables

The ECG under the influence of emotion due to operation after anaesthesia and after some surgical interventions on the carotid sinus and ANS. Polish. Arch. Med. wetn. 1953, 23/2 (263-290) Graphs 2

In 21 patients examined immediately prior to operation the following changes were observed in 20 cases as compared to the ECG taken 1 day prior to operation: acceleration of the heart's action, elevation of P11, III flattening of the T-wave and lowering of the ST segment. The changes in ST and T were more evident in all cases, after i.v. injection of morphine and atropine. During the first stage of pentothal anaesthesia these changes either increased or decreased. 24 hours after the operation all ECGs returned to their initial patterns. Unilateral novocaine block of the carotid sinus was without effect on the ECG, whilst its denervation caused in 2 out of 12 cases flattening or inversion of the T-wave in all leads. In some cases where block, vagotomy or sympathectomy were performed, no significant changes in the ECG were observed.

TITLE: Concentration of stresses in the vicinity of an elliptic opening in a non-slanting spheric shell

SOURCE: Khar'kov. Politekhnicheskiy institut. Dinamika i prochnost' mashin  
(Dynamics and strength of machines), no. 3. Kharkov, Izd-vo Khar'kovskogo univ.,  
1966, 23-29

TOPIC TAGS: stress concentration, stress distribution, spheric shell

ABSTRACT: The problem of stress concentrations in the vicinity of an elliptic opening in a spheric shell is generalized to the case of a non-slanting spheric shell with an elliptic opening of finite size and of arbitrary eccentricity. As shown by V. Z. Vlasov in 1962, the problem is expressed by four differential equations

$$\nabla^2 w_j + \mu_j w_j = 0 \quad (j = 0, 1, 2) \quad (1)$$

$$\nabla^2 \chi + 2\chi = 0, \quad (2)$$

where

$$\mu_0 = 2, \quad \mu_{1,2} = 1 \pm i \frac{2R}{\delta} \sqrt{3(1-v^2)}, \quad (3)$$

$$\nabla^2 = \frac{R^2}{AB} \left[ \frac{\partial}{\partial \alpha} \left( \frac{B}{A} \frac{\partial}{\partial \alpha} \right) + \frac{\partial}{\partial \beta} \left( \frac{A}{B} \frac{\partial}{\partial \beta} \right) \right]. \quad (4)$$

Card 1/2

ACC NR: AT6034485

The bending  $w$  is the sum of  $w_1$ ,  $w_2$ , and  $w_3$  found by the solution of Eqs. (1) and (2). The components of the stress- and deformation state are given by the functions  $w = w(\alpha, \rho)$  and  $\chi(\alpha, \rho)$ . By choosing proper coordinates, the equations are solved by separation of variables, and the problem is reduced to the determination of the eigenvalues and eigenfunctions of the differential equation of Lameth with periodic boundary conditions. SOURCE: Electrotehnica, no. 8, 1964, 289-294

TOPIC TAGS: electrical power engineering, electric rotating equipment

Abstract [Authors' English summary modified]: An experimental study of the characteristics  $M = f(\beta)$  for synchronous and asynchronous machines. Synchronous machines with powers of 300 to 1,000 kilowatt were studied, especially with regard to the dependence of the coupling during the starting process on the tension and resistance to which the exciting winding is connected. For asynchronous motors, the relation between the characteristic  $M = f(s)$  and the slot type and inclination was studied. Orig. art. has 2 figures, 4 formulas, 5 graphs, and 2 tables.

PERIODICAL:

Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 3, pp. 620-624  
(USSR)

ABSTRACT:

In the iodination and reaction with metallo-organic compounds of the selenophene nucleus in 3-methylselenophene and 2,4-dimethylselenophene (Ref 5) the authors assumed in consequence of the analogous structure of seleno- and thiophene that there must be also an analogy with respect to their chemical properties. Therefore they assumed a priori that in the 3-methylselenophene the substitution of hydrogen by iodine is accompanied by the formation of 2-ido-3-methylselenophene, which after the action of lithium phenyl and after carbonization converts to 3-methyl-

X. Synthesis of the 3-methylselenophene-2-Aldehyde and  
2,3-as Well as 2,4-Dimethylselenophene

selenophene-2-carboxylic acid. They also concluded that in the iodination of 2,4-dimethylselenophene the substitution of hydrogen by iodine in the position 5 of the nucleus takes place at a formation of 5-iodo-2,4-dimethylselenophene. Therefore, after its metal reaction and carbonization they attributed to the final product the structure 2,4-dimethyl-selenophene-5-carboxylic acid. The proof had, however, to be given that in the presence of a methyl group in the position 3 of the selenophene nucleus halogenation and mercurization actually take place in the position 2 and that also with 2,4-dimethylselenophene this substitution reaction takes place in position 5. In the present work convincing proof is furnished for this orientation with regard to 3-methyl- and 2,4-dimethylselenophene in the iodination and mercurization. For the synthesis of 2,4-dimethylselenophene the authors used the 2-methylpentene-3, which was added to the reaction with selenium dioxide in the presence of chromium oxide and aluminum oxide, as well as to the reaction with metallic selenium (see mentioned reaction process). From this can be seen that from the step-by-step process only

Card 2/3

Selenophene Chemistry

X. Synthesis of the 3-methylselenophene-2-Aldehyde and  
2,3-as Well as 2,4-Dimethylselenophene

79-28-5-12/61

one 2,4-dimethylselenophene could be obtained. For the synthesis of 2,3-dimethylselenophene the 3-methylselenophene was used the formulation of which leads to an aldehyde to which the structure 3-methylselenophene-2-aldehyde was attributed; this could be supported by experiments. This aldehyde converts to 3-methylselenophene-2-carboxylic acid in oxidation, and to 3-methylselenophene-2-carbinol in reduction. In the investigated reactions of halogenation, mercurization and formulation of 3-methylselenophene it was also proved that the substitution of hydrogen takes place in the position 2 of the selenophene cycle (see formulae).

TITLE: Chemistry of Selenophene (Khimiya selenofena). XVIII. Synthesis of the Isomeric Trimethyl Selenophene and of Tetramethyl Selenophene (XVIII. Sintez izomernykh trimetilselenofenov i tetrametilselenofena)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 6,  
pp 1970 - 1973 (USSR)

ABSTRACT: The authors continued their investigation on the methyl homologues of selenophene (Ref 1). They made use of the possibility of a subsequent formylation of the selenophene and the reduction of the aldehyde group into the methyl group for the synthesis of the trimethyl selenophene and of tetramethyl selenophene, hitherto unknown. The synthesis of 2,3,5-trimethyl selenophene was based on 2,3-dimethyl selenophene which, by the action of dimethyl formamide, led to the 2,3-dimethyl selenophene-5-aldehyde. This aldehyde yielded the 2,3-dimethyl selenophene-5-carboxylic acid in the case of oxidation with silver oxide. In the reduction according to the general method by Kizhner (Ref 3) the 2,3,5-trimethyl selenophene was obtained.

Isomeric Trimethyl Selenophene and of Tetramethyl Selenophene

3,4-dimethyl selenophene served as initial product for the synthesis of 2,3,4-trimethyl selenophene. Its formylation yielded 3,4-dimethyl selenophene-2-aldehyde the oxidation of which led to the 3,4-dimethyl-selenophene-2-carboxylic acid. In the reduction of 3,4-dimethyl selenophene-2-aldehyde 2,3,4-trimethyl selenophene was obtained, which served as initial product for the synthesis of tetramethyl selenophene. In the formylation of 2,3,4-trimethyl selenophene 2,3,4-trimethyl selenophene-5-aldehyde was obtained, which in the case of oxidation formed 2,3,4-trimethyl selenophene-5-carboxylic acid, in the case of reduction 2,3,4,5-tetramethyl selenophene (Scheme 2). From the two isomeric trimethyl selenophene only 2,3,4-dimethyl selenophene yielded the 5-chloro mercuri-2,3,4-trimethyl selenophene by means of mercurization; the 2,3,5-trimethyl selenophene did not enter this reaction. There are 7 Soviet references.
