SPL 7 20 46
SUBJECT: USSR/Geography

25-6-39/46

AUTHOR: Gal'tseva, P.G.

TITLE: At the Map of the World (U karty mira)

PERIODICAL: Nauka i Zhizn' - June 1957, # 6, pp 60-61 (USSR)

ABSTRACT: This is a critical review of a geographical brochure series named "U karty mira", published by the State Publishing House of Geographic Literature. Each brochure deals with one country, its economy, political system, history, population, and culture. The issues are profusely illustrated and not expensive. While the articles in these brochures are well written when dealing with geography, history and travels, those about the political system of a country and its economy remind one of reference manuals due to the abundance of statistical facts. This, according to the author, is the only deficiency of the series that is well liked by the readers.

The article contains 9 pictures.

TITLE: Investigation and Utilization of Water Resources in Czechoslovakia (Izucheniye i ispol'zovaniye vodnykh resursov v Chekhoslovakii)

PERIODICAL: Priroda, 1958, Nr 6, p 31-84 (USSR)

ABSTRACT: Czechoslovakia is a great water consumer, due to its highly developed industry and dense population. The main resources are rivers (shallow with a widely fluctuating level). For this reason, the construction of reservoirs is the most important problem. At present there are 15 reservoirs under construction with a total capacity of 1.6 billion cu m. Another 17 reservoirs will be built within the next 20 years. Regulation of the river beds and fortification of the banks are of vital importance. An extensive irrigation system is also under consideration. Since many of the rivers are polluted by waste water from industrial plants, water purification problems have to be solved and better cleaning methods used. Czechoslovakia's expert hydrologist, Academician Ya. Smetana of the Central Scientific Research Institute of Water Economy of the Czechoslovakian Academy of Sciences, is responsible for the development of the entire water system of the country. Professor

"Conference on the Problem of the Water Cycle in the Atmosphere," A. P. Galtsov

"Iz Ak Nauk SSSR, Ser Geograf" No 6, pp 71-89

Presents contents of conference in which was discussed theoretical and practical significance of the water cycle for the realization of Stalin's plan to transform nature. It was suggested that the results of work on water cycles be published in popular scientific books.

Gal'tsov, A. P., O klimaticheskoi vzaimodelstviu oroshаемykh i neoroshаемykh ploshchadei. [Climatic interaction of the irrigated and nonirrigated areas.] *Akademiia Nauk SSSR, Izvestiia, Ser. Geogr.*, No 3:11-20, 1953. DLC--Methods and results of microclimate observations carried out in Sept. 1951 by a group of Geographical Institute workers in irrigated cotton fields and adjoining desert lands near the lower reaches of the Amu Darya River in Kazakhstan. The measurement of air temperature and air humidity with ventilated psychrometers at 20 and 150 cm heights and wind speed measurement with hand anemometers at 1 and 2 m heights at 5 points (3 on irrigated fields and 2 on desert land), oriented as to wind direction, showed the gradual transformation of air currents coming from the desert, and its influence on the microclimate. The results of observation, presented in graphs and tables, show that 1) the presence of surface temperature inversions does not protect the oasis from the influence of the desert and 2) that the transformation of air masses proceeds along the same lines during the day and at night. The marginal irrigated lands, to a distance of several km from the desert boundary line, experience the drying effect of deserts and require more irrigation than the central portion of the oasis. *Subject Headings:* 1. Irrigation effects 2. Desert influences 3. Kazakhstan, U.S.S.R.—A.M.P.

Atmosfera zemli. Sbornik. [Earth's atmosphere. Symposium.] Moscow, Gosizdat. Kul'turno-Prosvetitel'noi Literaturny, 1943. 422 p. fig., tables, chart, illus. Price: 13 r. 70 k. DLC—This is a fascinating and challenging book for popular use (30,000 copies were printed), consisting of 14 articles by different authorities, arranged under 5 major headings: 1) atmosphere and sun, 2) weather and climate, 3) work of the wind, 4) air and life and 5) wealth of the earth's atmosphere. An article by E. L. DEBRINSKIĬ on atmospheric structure is an accurate and quite technical treatise on every aspect of the troposphere, stratosphere and ionosphere and processes going on in these regions. The second article by the late Prof. N. N. KALITIN discusses the physical and physiological aspects of solar radiation in all latitudes and under varying weather conditions. Ch. 3, by A. KH. KURBAN, deals with optical phenomena in the atmosphere (halos, mirage, visibility, rainbows, etc.). The section on weather and climate, contains articles by A. F. GAL'TSOV on weather, weather analysis and weather forecasting; by V. IU. VIZE on the Arctic and Africa; by L. A. CHURNOV on weather and climate and by S. A. SANOZHNIKOVA on microclimatology, climate over tundra, forests, lakes; snow microclimate, soil and slope microclimate, dust storms and their prevention, and human climatology. The section on work of the wind has an article by B. A. FIDOROVICH on action of wind on soil and the earth, one by N. A. BELINSKIĬ on wind, waves and foundations, one by A. V. KARMSHIN on the use of wind power, showing many conventional and several recent models of the wind generators for use in the Arctic. The section on air and life contains articles by N. S. SICHURINSKIĬ on the relation of the atmosphere to plants, birds, fish, animals and insects; one by G. N. KASSIL' on man and air, atmospheric pollution, etc. and one by M. I. GOL'DIX on microbes and air in Arctic, at sea, in upper air and in rooms, etc.; and the final section on wealth of the air by D. IU. GASHURG, goes into the composition of the atmosphere, the rare gases, CO₂ and nitrogen cycles, air conditioning, etc. Although designed for high school students every chapter is written by an outstanding specialist in a particular field of meteorology, and contains an amazing amount of technical information not usually found in such elementary texts, as well as a host of clever schematic diagrams and beautifully colored photographs or charts. No literature citations are given, though there is a great deal of historical material scattered in the Russian contributions in each field. An English edition of this book would be a most valuable work. Subject Headings: 1. Elementary meteorology 2. Russian science 3. Collected works. Textbooks. I. Dzerdzevskii, B. L. II. Kalitin, N. N. III. Kurban, Kh.

Call Nr: AF 1139270

Analysis of Climate-forming Processes (Cont.)

PURPOSE: The book presents a method of qualitative analysis of climate-forming processes and its application to a genetic classification of fogs. It is designed for geophysicists, meteorologists, hydrologists and students of these fields.

COVERAGE: This book analyzes the causes and developments of climatic phenomena and their interaction with other environmental factors. The material offered leads to the formulation of a genetic method of analysis and long or short-term forecasting of the weather. The book contains Russian contributions. Personalities mentioned include: Bachurina, A.N., Blyumina, L.I., Petrova, L.I., Alisov, B.P., Fedorov, Maksimov, Dyubyuk, A.F., Chubukov, L.A., Berlyand, M. Ye., Zavarina, M.V. There are 85 bibliographic references, 41 of which are Slavic, 26 English, 17 German and 1 French.

TITLE: At the XIth General Assembly in Toronto of the International Union of Geodesy and Geophysics (IUGG) (Na XI general'noy assambleys mezhdunarodnogo soyuza geodezii i geofiziki (IUGG) v Toronto)

PERIODICAL: Izvestiya Akademii nauk SSSR -- Seriya geograficheskaya, 1958, Nr 2, pp 3-8 (USSR)

ABSTRACT: The XIth General Assembly of the International Union of Geodesy and Geophysics convened in Toronto from 3 to 14 September 1957. The USSR was represented by a delegation consisting of 54 scientists headed by Academician I.P. Bardin. The Soviet geographers G.A. Avsyuk, A.P. Gal'tsov, M.I. Iveronova and Yu.A. Meshcheryakov participated for the first time in a meeting of the Union. The conference was divided into various sections dealing with special fields. The conference heard the following Soviet reports: The Geodesists M.S. Molodenskiy, A.A. Izotov, Yu.D. Bulanzhe and M.I. Sinyagina on the achievements of Soviet science in the geodesy; V.V. Belousov, V.A. Magnitskiy, Ye.A. Lyubimova, V.I. Keylis-Borok and Yu.V. Reznichenko on seismological problems and questions concerning the physical structure of the Earth's deposits; G.A. Avsyuk on glacial research work

Card 1/3

10-58-2-1/30

At the XIth General Assembly in Toronto of the International Union of Geodesy and Geophysics (IUGG)

carried out in the USSR; A.M. Obukhov and A.S. Monin on meteorological questions, especially diffusion and convection. Special attention was paid to the reports of the Soviet scientists M.I. Sinyaginaya and Yu.A. Meshcheryakov on the study of present movements of the Earth crust in the European part of the USSR. M.I. Budyko dealt with the distribution of the components of the thermal balance of the Earth's surface. This report met with especially great interest since only the USSR has succeeded in preparing monthly charts on the components of the thermal balance all over the world, and what is even more important, in solving the problem of determining the evaporation taking place on the surface of dry land. Ye.P. Tolstik explorer of polar regions reported on Soviet research in the Arctic and Antarctic Zones within the International Geophysical Year. Due to the Soviet achievements in all these fields of science V.V. Belousov, Corresponding Member of the AS, USSR was elected Vice-President of the

AUTHOR: Gal'tsov, A.P.

TITLE: A Conference on the Problem of "Heat and Water Balance of the Earth's Surface, its Importance for the Dynamics of Natural Phenomena and Methods for its Transformation for Practical Use"

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geograficheskaya, 1959, Nr 5, pp 130-134 (USSR)

ABSTRACT: The above-mentioned interdepartmental conference took place on 7-11 April 1959 in Leningrad. It was organized by the Institut geografii AN SSSR (Institute of Geography of the AS USSR) and by the Glavnaya geofizicheskaya observatoriya im. A.I. Voyeykova (Main Geophysical Observatory imeni A.I. Voyeykov). In his opening address, Academician I.P. Gerasimov indicated the general purpose of the conference, the present state of investigations and their further development. Several reports read at the conference could be divided into

Card 1/6

A Conference on the Problem of "Heat and Water Balance of the Earth's Surface, its Importance for the Dynamics of Natural Phenomena and Methods for its Transformation for Practical Use."

five cycles. The first cycle contains four reports on the problems of study of the heat balance of the Earth's surface. They were delivered by: M.I. Budyko (GGO) on "The Heat Balance of the Earth's surface"; Yu.D. Yanishevskiy (GGO) on "Methods of actinometric investigations"; T.G. Berlyand (GGO) on "The Distribution of Solar Radiation on the Earth's surface"; and B.L. Dzerdzeyevskiy and Yu.L. Rayner (Institute of Geography of the AS USSR) on "The State and Problems of Study of Heat Balance of a Forest". The second cycle of reports concerned water balance problems. 5 reports were read by: G.P. Kalinin (TsIP) on "General Problems of Water Balance"; V.I. Kuznetsov and I.V. Popov (GGI) on "Experimental Research on Elements of Water Balance of Dry Lands"; M.I. L'vovich (Institute of Geography of the AS USSR) on "Methods

of Investigations of Water Balance"; A.I. Budagovskiy (Institute of Geography of the AS USSR) reported on the importance of the study of water balance of soils, which is a synthesis of the dynamics of water and heat balances of the Earth's surface; the last report of this cycle was read by V.D. Komarov on "Zonal Peculiarities of Formation of Spring Water Discharge on the European Territory of the USSR". The third cycle concerned the interconnected problems of formation and dynamics of snow cover, glaciers and of permafrost. Four reports were read by: G.A. Avsyuk (Institute of Geography of the AS USSR) on "General Problems of Glaciologic Research in the Frame of the Problem"; G.D. Rikhter (Institute of Geography of the AS USSR) on "Problems of Study of Snow and Snow Cover in the Frames of the Problem";

of the Theory of Climate Formation"; O.A. Drozdov (GGO) on "The Humidity Circulation in the Atmosphere"; and M.P. Timofeyev (GGO) on "The Heat Balance and the Microclimate". The Fifth cycle of reports concerned the analysis of the role of the water thermal balance of the Earth's surface in the formation of the natural atmosphere. Academician A.A. Grigor'yev reported on "The Role of Heat and Water Exchange in the Formation and Development of the Geographical Sheath (mainly on temperate belt plains) and their Importance for the Productivity of Agriculture Plants"; Academician I.P. Gerasimov on "Hydrothermal Factors of Soil Formation"; V.R. Volobuyev (AS of the Azerbaydzhanskaya SSR) - on "The Summary Expenditure of Energy for the Soil Formation in connection with Hydrothermal Conditions"; D.L. Armand

TITLE: Use of the patterns of world precipitation distribution in connection with the problem of genetically classifying climates

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 7, 1962, 55-56, abstract 7B286 (V sb. XIX Mezunar. geogr. kongress v. Stokgol'me, 1960, M., AN SSSR, 1961, 80-87)

TEXT: The genetic analysis of precipitation is highly significant for the construction of a world climate classification and requires the disclosure of a whole chain of causes and consequences right down to the primary factors. It can be accomplished only in stages. The investigation's aim was to ascertain the relation of the mean multiyear precipitation totals to certain climatic indices, depending closely on the primary factors of climate formation. The rising air current (convection, ascent in fronts, and so forth) is the direct cause of the bulk of the precipitation. The magnitude

of the vertical velocity of such currents can serve as the characteristic of the conditions for their development. Its trial calculation from the distribution of the mean multiyear pressure showed insufficient precision. This method had to be rejected, and the so-called vergence index had to be taken in its place as the indirect index of the development conditions for vertical movements. By the new index is implied the difference between the pressure at a given point and at a nearby point on the zero isoline between zones where ascending and descending flows predominate. A map of the vergence index's world distribution in January is given. Another important factor, on which the precipitation depends, is the moisture content; the mean value of the near-surface water-vapor tension, which can be determined on a standard grid of meteorologic stations, was used as the characteristic of this latter quantity. An attempt was made to determine the specific influence of the vergence index and the near-surface water-vapor tension in the processes of the accumulation of climatologic precipitation totals. The former factor is an integral characteristic of the circulation; the latter reflects the joint influence of solar heat

inflow and the degree of the ground surface's humidification. A series of other factors, influencing the formation of precipitation, was not considered, The empirical formula

$$r = 2,3 \cdot e^{0,928(0,1p+1)} \cdot E + 2^{0,2p+3,5}$$

expressing the dependence of the climatologic precipitation total (r) on the average near-surface water-vapor tension (E) and the mean vergence index (p), was found as a result of the conducted investigation. This formula provides an opportunity for determining the quantitative contribution of each of the two factors considered, and of the total influence of all factors that were not considered, to the spatial precipitation-total differences, observed between different areas, and to the precipitation's annual variation in the same area. Moreover, the accurately established boundaries of tradewinds in each month allow the boundaries of the main climatic belts in low latitudes to be defined more accurately. ✓

The results of this more precise definition are shown on the cited map. Patterns in the formation of climatologic precipitation totals in extratropical latitudes allows groups of continental and marine precipitation processes to be distinguished. The magnitude of the range of the precipitation's yearly variation can be resolved into three components: 1) the change in the precipitation total at the expense of that in the humidity; 2) their change at the expense of the change in the vergence index; and 3) their change at the expense of factors not considered. Such a method allowed two typical provinces to be distinguished in the sphere of the continental precipitation process: 1) continental proper, where the precipitation grows from winter to summer at the expense of the increase in the humidity and the vergence index, though this is counteracted by the influence of factors that were not taken into account; and 2) maritime, where the growth of the amount of precipitation towards summer is accomplished solely at the expense of the humidity. The patterns found can be used in many other questions of genetic climatology. [Abstracter's note: Complete translation.]

century". Al Halaf (Al'-Khalaf)(Iraq) presented the paper "Basin of the Lower Tigris". The paper of Skribnyy (USSR) -- "Peculiarities of the genesis of floods, their bases of analysis and reckoning" -- proposes a hygenic classification of floods and states a theory for reckoning them. The Rumanian hydrologists Platagva and Uivari (Uyviri) presented a paper about the hydrologic conditions on Rumanian territory. Patterns of climatic variation in the Ukraine were discussed in Buchinskiy's (USSR) paper. Gal'tsov (USSR) came forward with a communication on the subject "Investigating patterns of world precipitation distribution in connection with the problem of genetic climatic classification". In the paper "Geographic analysis of precipitation" Gregory (Great Britain) reviewed climatic investigations, carried out from the data of 6000 stations of the British rain-measuring grid. The paper of Meidech (USA) -- "Role of the water balance in the soil redistribution of strontium" -- elucidated the results of theoretical and experimental investigations of precipitation fallout and radioactive strontium migration in groundwaters. Thorntweisht (Torntueyt) (USA) in his paper "Water balance investigations carried out by the Climatology Laboratory" generally review-

ed the laboratory work that he directed for 20 years. In the paper "Unique curves of the general course of precipitation in inland regions of the USA" Treworth (Trevort) (USA) characterized the precipitation regime in Texas and Oklahoma and in the valley of the Upper Mississippi. Bailey (Beyli) (USA) gave the communication "Method of determining climatic warmth and moderation". Kerry (Kerri) (New Zealand) in his paper "Probability interpretation adapted to climatic conditions" touched on the question of the adaptation of vegetation, glaciers, the water regime, and other phenomena to climatic changes. Malmstrom (Mal'mstrem) (USA) considered "Harvest and climate in Iceland; role of the Arctic front". Budyko (USSR) stated the results of research, carried out in different scientific institutions of the USSR, on the heat and the water balances and their relation to various natural processes. The data of microclimatic observations, conducted on the streets of London by means of a specially equipped automatic machine, were cited in the paper of Chandler (Chandler) (Great Britain) -- "Climatic investigations of London". The paper of Vlon (Flon) (FRG) -- "Mechanism of the summer monsoon in south and east Asia" -- summed up multiyear investigations of tropical and

and subtropical monsoons. The paper of Okołowicz (Okolovich) (Poland) was called "Macro-, meso- and microclimates, their correlation and methods". The paper of Paszyński (Pashinskiy) (Poland) was devoted to the topic "Atmospheric turbidity as a factor in the local climate of industrial areas". Dzerdzeyevskiy (USSR) examined the question of multiyear fluctuations of climatic elements at different points in the northern hemisphere. The communication of Shatier (Shat'ye) (France) considered the influence of urban water research on the discharge of the R. Seine at Paris.

TITLE: Conference on the problem of transforming the climate

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 3, 1962, 50, abstract 3B369 (Izv. AN SSSR, ser. geogr., no. 5, 1961, 128-133)

TEXT: A report is given about the proceedings of the Leningrad conference of April 25 - 28, 1961, on the problem of transforming the climate. The conference was organized by the Glavnaya geofizicheskaya observatoriya im. Voyeykova (Chief Geophysical Observatory im. Voyeykov) and the Instituty prikladnoy geofiziki i geografii AN SSSR (Institutes of Applied Geophysics and Geography, Academy of Sciences USSR). The following papers were read and discussed at the conference: Academician Ye. K. Fedorov -- "Research prospects for the problem of transforming the climate"; Academician I. P. Gerasimov -- "Climatic changes in the Quaternary Period"; A. V. Shitnikov -- "Present phase of the general humidification of
