3256. AMYLOIDOSIS IN THREE CASES OF SPONDYLARTHROSIS ANKYLOPOETICA (MARIE-STRÜMPPELL-BECHTEREW) - Amyloidosa u tří případů spondylarthrosis ankylopoetica - Händlová D. Výzkumný Úst. Chor. Revmat., Praha - ČAS. LÉK. ČES. 1958, 97/15-16 (478-482)

In the 1st case amyloidosis was not diagnosed during life, in the 2nd case the kidney was affected by amyloidosis with a glomerulonephritic character, nephrotic type (haematuria and hypertension), despite the fact that inflammatory changes were not seen in the post-mortem kidney. In the 3rd case albuminuria was observed without changes in GFR or concentrating ability, with a marked loss of protein into the urine. The report is considered important because the majority of authors consider Marie-Strümpell disease as a separate entity, not identical with vertebral chronic progressive polyarthritis.

TITLE: Twin isothermal gamma calorimeter with thermistors

SOURCE: Jaderna energie, no. 4, 1966, 121-126

TOPIC TAGS: calorimeter, thermistor, gamma radiation, radioactivity measurement

ABSTRACT: The construction of a calorimetric assembly suitable as fundamental laboratory equipment for activity standardization measurements of  $\gamma$  sources is described. The twin isothermal calorimeter with lead absorbing bodies is suspended in a thermostating oil bath and continuously evacuated. Thermistors are used as temperature sensitive elements. A relatively simple method of measurement and results of electric power calibration are presented. The sensitivity of calorimeter is  $7.42(10)^{-2}$  deg per milliwatt. The verification measurements of  $^{60}\text{Co}$  sample activities have proved that the new reported modification of isothermal calorimeter allows measuring activities of  $^{60}\text{Co}$  from 20 mC and with accuracy up to 1 per cent. them are described and the results obtained are discussed. Consecutive measurements using the Pulfrich photometer gave temperatures of the flowing gas to be between 1200 and 1500C; the reason for this temperature spread is discussed. Tungsten filament sensors were used in the resistance method. Using this method it was impossible to measure the gas temperature because the high temperature and gas velocity quickly destroyed the filaments. Only the temperature of the tunnel walls could be measured by inserting the sensors in special holes inside the walls. W-C thermocouples were used in the thermoelectric method. The design and calibration of the thermocouples is described. No positive results were obtained because of the mechanical instability of the thermocouples. The method using fuse wires appeared to be the simplest and most convenient. The minimum time required for melting a fuse wire for a given ambient temperature is discussed. It was determined that for wires (copper, iron, molybdenum, tungsten) 1 mm in diameter, this time is less than 1 sec. The temperature at the exit of the tunnel as determined by this method was 1500C. It is concluded that conventional high-temperature measurement methods can be used to measure temperatures of low-velocity hot gas jets not exceeding 2000C. For high-velocity gas jets temperatures exceeding 2000C optical methods should be used. A list of factors which must be considered when choosing the method of temperature measurement is presented. Orig. art. has: 6 figures, 2 tables, and 2 formulas.

TITLE: Some problems concerning the measurement of temperature of hot gas jets

SOURCE: Pomiary, automatyka, kontrola, no. 8, 1965, 340-342

TOPIC TAGS: gas flow, gas jet, MHD generator, temperature measurement, high temperature research 9M

ABSTRACT: The paper discusses some problems associated with the measurement of temperatures of hot gas jets in the experimental MHD generator<sup>11</sup> of the Poznan Polytechnic Institute. The conditions existing in the tunnel of the generator which seriously hinder the use of conventional methods of measuring high temperatures are listed and discussed. The possibility of using conventional measurement methods in MHD generators was studied using an electric arc inside a plasmatron as a source of temperature. In the optical method an EP-5 monochromatic pyrometer and a Pulfrich photometer were used; the difficulties experienced in applying these instruments for this purpose and the measures taken to circumvent

TITLE: The influence of storage temperature on the change of polarity of electrets

SOURCE: Acta physica polonica, v. 29, no. 5, 1966, 623-630

TOPIC TAGS: storage temperature, polarity change, electret

ABSTRACT: The influence of the temperature at which electrets of beeswax were stored on the time of transition of a heterocharge into a homocharge has been studied. Increasing the temperature of the electrets before removal of the polarizing electrodes caused an increase in the time after which polarity reversal occurred; a decrease in storage temperature shortened this time. Variations of the storage temperature of electrets after the electrodes had been removed caused the opposite effects of those mentioned above. The results obtained speak against

ABSTRACT: The influence of the conditions of polarization and preservation of the electrets of beeswax, pure resin, their mixtures and polymethacrylate on the time of change of polarization and a dielectric delay effect was investigated. The results obtained suggest a certain new point of view on the mechanism of the electret phenomenon, in particular on the extraction homocharge. "The author wishes to thank Professor T. Piech for his kind interest throughout this investigation and for his many valuable discussions." Orig. art. has: 6 figures. 44,55

| ABSTRACT   | A new rapid gravimetric method is proposed for the quantitative determination of pyramidine in preparations, tablets, or in mixtures with veronal in 'Veropirin' tablets. The method is based on the precipitation of pyramidine in hot HCl with a 10% aqueous solution of silicotungstic acid. The proposed method is simple and accurate.<br>From authors' summary |       |

forming is heated for 5 min over a water bath. After 15-20 min the precipitate is filtered through a No 2 Gooch crucible and washed successively with a solution containing 3%  $\text{NH}_4\text{NO}_3$  and 0.2% I, water, 95%  $\text{C}_2\text{H}_5\text{OH}$ , and ether, after which it is dried in a vacuum-dessicator and weighed. The residue after the water washing can also be dried in a drying oven at 130° and weighed in the form of  $\text{Cu}[\text{Fe}(\text{CN})_5\text{NO}]$ . The presence of Fe(II), Zn(II), Pb(II), Al(III), Mn(II), Fe(III), Bi(III), Ca(II), Sr(II), and Ba(II) does not interfere with the Cu determination. Ag(I), Hg(II), Cd(II), Ni(II), and Co(II) are precipitated together with Cu(II) and consequently interfere with the determination of the latter. The error of the determination is  $\pm 0.03\%$ . -- B, Manole

The third edition of the *Modern Romance* contains an additional sexual and pornographic interpretation of the story. It was first published in 1971 by New World Books. The book is a collection of 12 short stories, each containing a different sexual situation. The stories are written in a variety of styles and tones, from explicit to more subtle. The book has been banned in many countries and has received mixed reviews. Some critics have praised it as a work of art, while others have condemned it as exploitative. The book has also been used as a teaching tool in some schools.

✓ 3776. Differences in the food choice of rats in neurogenic and renal hypertension. E. Boros, M. Händel, G. Hermann, and J. Sós  
*Acta physiol. Acad. Sci. hung.*, 1954, 6, 321-329 (II. Med. Clinic and Inst. of exper. Pathol., Med. Univ., Budapest, Hungary).—  
Rats with established hypertension either of neurogenic or of renal origin could choose between normal (14% protein), protein-rich (37% protein), protein-free, vitamin B-rich (B<sub>1</sub>, B<sub>2</sub>, B<sub>6</sub>, B<sub>x</sub>, vitamin N) added to the normal diet, and vitamin B-poor (normal diet without 3% yeast) diets. Rats in neurogenic hypertension eat significantly more of the B rich diet than do those in renal hypertension. There is no difference in their consumption of fat, carbohydrate, and protein. Renal hypertensive rats eat the same amount of fat, carbohydrate, and protein as normal ones, but their vitamin B-rich diet consumption is small. (German) A. B. L. BEZNÁK.

(6)

Effect of medication and diet on experimentally produced neurogenic hypertension in rats. M. Handel, P. Kettai, J. F. Weisz, and I. Balkanyi (*Acta physiol. Acad. Sci. hung.*, 1953, **4**, 315-322).—The normal blood pressure of 110 mm. Hg rises to above 150 mm. Hg in rats stimulated daily for 40 consecutive days by whistle sound, induction shocks, and strong light for 10 min. each. The neurogenic hypertension persists for 2 to 4 weeks after the cessation of the stimulation. Simultaneous administration of Tetracor (penta-methylentetrazol) increases hypertension, it prolongs the rise. Tetracor alone causes no hypertension. Rats on methionine- and tryptophane-free diets do not develop hypertension by these treatments, but hypertension develops when they are given a complete diet. Hypertension does not develop or is small if Sevonal is given to rats during the 40 days period of stimulation.

"On the Pathogenesis of Fetal Damage"

Budapest, Orvosi Hetilap, Vol 107, No 12, 20 Mar 66, pages 539-543.

Abstract: Some of the factors which may contribute to fetal damage  
are evaluated briefly. Among these are the effects of previous instrumental  
abortion, microbiological causes, alcohol-coffee-smoking, ABO blood group  
incompatibility, the time of conception and pathospermia. 16 Hungarian, 24  
Western references.

TITLE: Intensification of the agglomeration process

SOURCE: Hutnik, no. 12, 1964, 576-578

TOPIC TAGS: metallurgical process, automation

Abstract: Improvement of the agglomeration process is achieved mainly by maintaining constant operating conditions. The importance of maintaining constant bulk density on the belt in charging devices and on the grate are discussed. Changes in the thermal parameters of operating conditions are evaluated. Factors disturbing the temperature profile are described. Changes in basic properties of raw materials and of the amount of fuel needed are discussed. Influence of recirculating part of the agglomerate is described. Causes of interruptions in the operating process are discussed. Instrumentation and automation of the process is evaluated.

TITLE: Investigation of some relations between various indices of the sintering processes

SOURCE: Hutnické listy, no. 4, 1966, 229-233

TOPIC TAGS: sintering, computer, metallurgic research/Sirius computer

ABSTRACT: 22 variables of the agglomeration process at the NHKG works were investigated; comparison of records showed that a ten day period provided data that were not subject to variations. These data were investigated by the method of regression analysis. The data were then processed in a Sirius computer; 17 input and 5 output indicators were recorded. The results obtained in the study are discussed and the importance of the individual factors presented. Orig. art. has: 5 tables. [Based on authors' Eng. abst.] [JPRS: 36,646]

Portable telephonometer

attenuation meter comprises two amplifier stages and a circuit for the evaluation of the relative attenuation, which is based on copper-oxide rectifiers and resistors. The above telephonometer is primarily designed for servicing and maintenance of telephone sets. The equipment is supplied from two batteries, giving 4.5 and 8 to 9 V.  
There are 4 figures and 4 Soviet-bloc references.

Fig. 5:

## Portable telephonometer

artificial mouth, MU is the artificial mouth, nf V is a low-frequency voltmeter, MU is the relative attenuation meter, NP is the supply bridge, P<sub>1</sub> is a six-way switch, mb are the terminals for connecting a telephone set of the local-battery type and ub are the terminals for connecting a central-battery telephone set. The artificial ear is permanently built into the cabinet and it is covered by a special lid when not in use. The noise-generator is based on a germanium junction diode which is followed by a 5-stage transistor amplifier. The artificial mouth has an input aperture of 2.5 cm and an external diameter of 10 cm. The source of sound in the artificial mouth is a loudspeaker, type ARO 131. The frequency of the artificial mouth over the bandwidth ranging from 230 - 4 000 c.p.s. does not vary by more than  $\pm$  4 db. The artificial ear is of the type recommended by CCITT. The amplifier of the artificial mouth is based on 3 transistors, the first of which operates as a pre-amplifier, the remaining two being connected as a push-pull output stage, the amplifier of the artificial ear is a 4-stage system with resistive inter-stage coupling. The relative

AUTHORS: Hančík, Josef, and Turko, Václav, Engineers

TITLE: Portable telephonometer

PERIODICAL: Sdělovací technika, no. 2, 1962, 60 - 61

TEXT: The equipment described is housed in a portable cabinet, 275 x 205 x 115 mm in size and 6.5 kg in weight). The effect of the human voice is imitated by means of a noise generator and when testing microphones the noise is reproduced by an artificial mouth; the signal from the noise generator is applied to the tested telephone set when measuring the receivers. The acoustical signal from the measured receiver is applied to an artificial ear and, after suitable amplification, it is applied to the input of a relative attenuation meter. The electronic part of the instrument is constructed as printed circuits and is based on transistors. The system is illustrated diagrammatically in Fig. 3, where UU is the artificial ear, ZUU is the amplifier of the artificial ear, GS is the noise-generator, ZUU is the amplifier of the

"Microbial Transformation of Steroids. XXVI. An Improved Method of Preparation of Cortisone from Cortexolone."

Prague, Ceskoslovenska Farmacie, Vol 15, No 4, May 66, pp 198-199

Abstract [Authors' English summary modified]: Beauveria bassiana strain No 663 gives a yield of over 90% in the transformation of cortexolone to epicortisol. The raw epicortisol is acetylated and oxidized selectively to cortisone acetate, without isolating the intermediate products. The acetate is saponified with sodium methoxide; free cortisone is obtained with a yield of 78% calculated on the basis of the original cortexolone. With recrystallized cortexolone the yield increases to 80%. 3 Czech references. (Manuscript received 3 Aug 65).
