"The Clinical Aspects and Therapy of Trichinosis"

Budapest, Orvosi Hetilap, Vol. 107, No 31, 31 Jul 66, pages 1449-1452.

Abstract: [Authors' Hungarian summary modified] The clinical manifestations, diagnosis and therapy of trichinosis are summarized on the basis of literature data. The course of the disease is described in response to treatment with chlorocide and prednisolone (4 cases) as well as thiabendazole (1 case; 40 mg/kg body weight daily doses for 3 days, a total of 7200 mg). It is stressed that severe cases of trichinosis must be given effective causal therapy in order to prevent the eventual lethal outcome of a massive infestation. 12 Hungarian, 9 Western references.

"Evoked Potentials in the Strychninized Cerebral Cortex of the Cat"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Supplement, to Vol 22, 1963; pp 27-28.

Abstract [Authors' English summary, modified]: The potentials evoked by an auditory stimulus, as well as the spontaneous strychnine potentials have been studied on the gyrus ectosylvius of cats anesthetized with chloralose. One percent GABA applied superficially on the cortex greatly augmented the evoked potentials. It is thought that the neuronal substrate of the specific evoked potentials differs from that of the strychnine effect. Some problems of the neuronal organization of the cortex, as well as the mode of action of GABA and of strychnine have been discussed.

KAUTON, Ferenc, Dr. HALASZ, Peter, Dr. Medical University of Debrecen, Neurological and Psychiatric Clinic (Közvetlen Orvostudományi Egyetem, Ideg-és pszichika) (director: FÜLÖP, Imr, Dr, ps. Szendrői).

"The Relation between Electroencephalographic and Motor Responses During Evipan Anesthesia."

Budapest, Életrajzok és tanulmányok, Vol. XIV, No. 26, Oct 1963, pages 306-318.

Summary: [Authors' Hungarian summary modified] In man, the "pure desynchronization" character of EEG responses to peripheral stimuli is the more pronounced the deeper the anesthesia. Biological signs of lessening narcosis are accompanied by more prolonged synchronization. An increased participation of more rapid frequencies in the EEG responses is evidenced. Later, double responses arise (desynchronization and post-synchronization). The awakening takes place at the time of "pure desynchronization" responses. During the effect of the barbiturate, the pupillomotor reactivity is sluggish compared to the morphological sensitivity of the EEG. Under the effects of moderate amounts of barbiturate, the EEG is hyperactive but is soon extinguished under deep anesthesia. 3 Hungarian, 32 Western references.

"Psychological Analysis of Frigyes Karinthy's Literary Talent"

Budapest, Magyar Pszichologiai Szemle, Vol 19, No 3, 1962, pp. 338-348.

Abstract: The writings of the late KARTIMPEY, Frigyes, a Hungarian humorist, were reviewed. His talents were attributed to abilities of observation, logical and psychological analysis, self-observation, style-imitation, to associate by similarity, and to associate on the basis of socio-stereotypic verbal experience. Twenty-three references, including 12 Hungarian (Karinthy's works), 5 Russian, and 6 Western.
