Title : Dust Control Problems in the Ceramic Industry.

Orig Pub : Eptocanyag, 9, No 2, 53-56 (1957) (in Hungarian)

Abstract : Measures are proposed for the reduction of dust production in the ceramic industry. The measures proposed deal with certain technological improvements (the introduction of pneumatic conveyor systems, indoor storage of materials, the mechanization of loading and unloading operations, etc. Flow diagrams of local filtration systems and of central circulation systems are presented.

Title : Upon the Purification of Sulfate Turpentine in People's
Republic of Rumania.

Orig Pub : Rev. chim., 1957, 8, No 3, 203-204

Abstract : Raw sulfate turpentine (ST) was treated with sodium
hypochlorite solution containing 12.5% of active chlo-
rine in order to destroy the disagreeable odor and to
prepare ST suitable for organic synthesis. The disagree-
able odor disappears at such a treatment in the result
of the oxidation of sulfite compounds and their conver-
sion into sulfons and sulfo acids. The ST properties
before purification: appearance - transparent fluid,

color - reddish brown, odor - strong and disagreeable,
 $d_{20}^{20} = -0.8784$, $[\alpha]_D^{20} = -10.2^{\circ}$. The fraction com-
position of purified ST is presented. The starting
boiling temperature is 140° ; 81.8% evaporates between
155 and 173° . The yield of purified ST is 60 to 65%.
The purified ST is suitable to the synthesis of terpi-
neol answering the standard requirements by its quality.

Budapest, Orvosi Hetilap, Vol 104, No 1, 6 Jan 62, pages 7-12.

Abstract: [Authors' summary modified] The first symptom of expansive processes of the mediastinum is often suffocation. This is caused by external pressure on the trachea or by paresis of the recurrent nerve. Mediastinoscopy is the newest diagnostic technique which is also useful for biopsy. 12 cases and their causative factors are reported.

AUTHOR: Hirschfeld, Guenter, Engineer

TITLE: Spectrographic determination of welding arc temperature

PERIODICAL: Zváračský sborník, no. 1, 1962, 31-44

TEXT: Welding-arc temperature in dependence on current was measured using a Zeiss Q 24 quartz-type spectrograph. Measurements with nonmelting electrodes of various diameters showed a steep initial temperature rise with increasing current density up to 150 A, and then remained nearly constant for the rest of the test current range of 250 A, eventually reaching a value of about 6100°K which is in good agreement with results obtained by other methods. Similar measurements with several commercial, coated-electrode types produced less consistent spectrograms due to material transfer, displacement of the arc column, and shorts during the exposures. Mean temperature values, as determined from at least five spectrograms for each electrode type, ranged from 5400 to 6040°K, depending on the coating thickness and composition. Attempts to apply the method to CO₂-shielded arcs were unsuccessful due to insurmountable experimental difficulties. ✓

Card 1/2

Spectrographic determination ...

Z/046/62/000/001/003/007
D007/D102

Measurements of argon-shielded arc temperatures (using copper spectral lines for determination) yielded a value of 5150°K. This is in good agreement with the value determined with the same method by G.M. Gordon, O.A. Cotter and E.R. Parker [Effect of Current and Atmospheres on Arc Temperatures. Weld. J. 35, 1956, 109], but is in strong disagreement with results obtained by other methods. A photographic method of temperature determination proved successful in the case of argon-plasma stream, but failed in the case of argon-shielded arcs. There are 10 figures and 2 tables. SOURCE: Ceskoslovenska neurologie, no. 3, 1965, 235

TOPIC TAGS: clinical medicine, neurology, nervous system disease, circulatory system disease, cerebral cortex, electroencephalography

ABSTRACT: Clinical and EEG observations of 64 patients are reported. All showed epileptic seizures first after reaching 40 years of age. Most cases showed clinical aspects of arteriosclerosis. EEG showed an obvious slowing down of rhythm. The epileptic irritation originates in arteries close to the brain cortex. [JPRS]

1648. The determination of crude fibre. II. V. P. Hirsjarvi with L. Anderson (*Z. anal. Chem.*, 1930, 101, 381).—The various modifications of the Weender method are reviewed. A further modified method is described; this is similar to that of Pyranen and Tomula (*Acta Chem. Fenn.*, 1930, 3, 65), but a special glass-wood filter is used. Comparisons made with three other modifications on 24 feeding stuffs show that the new method is specific and has better reproducibility. An extensive bibliography is appended. E. HAYES.

TOPIC TAGS: neuron, electronic simulation, cybernetics

ABSTRACT: The author discusses the results of a graphical analysis of the properties of a neuron on the basis of assumptions concerning neuron activities. Conclusions are derived concerning the relationship between the input and output signals on the basis of the fact that the frequency of the input signal of a neuron is synchronized with the frequency of the output signal. The entire process is simulated in an electronic model. There are many gaps at present in the knowledge of the properties of a neuron because of the enormous complexity of the nervous system and the difficulties involved in observing a live-separated nerve cell. The purpose of the study was to indicate the influence of the changes of the relative width of the active area of the

neuron model with regard to the value of the threshold and the resulting changes in the method of processing of the input information. The author shows how graphs presented can be used to determine a complex network consisting of a larger number of nonadaptive neurons. Input and output signals of an electronic model of a neuron are illustrated and it is noted that the model will be related later to the results obtained in a more complex model of a neuron network.
