"Research on Speech in Hypnotic Age Regression."

Prague, Activitas Nervosa Superior, Vol 5, No 1, Jan 63; pp 13-21.

Abstract (English summary modified): Enunciation of 16 words was compared in children aged 0.5, 1 and 2 years; in adults instructed to pronounce these words as children of these ages; and in 6 adults during hypnotic regression at said ages. Authors conclude that there is no true regression; hypnotized adults seem to overestimate the ability of the children to enunciate the words tested. Four tables, 20 Western, 7 Soviet and 6 Czech references.

(Psychiatricka klinika fakulty vseobecneho lekarstvi KU)TITLE: Some controversial problems of the role of psychiatry in the fight against
criminality

SOURCE: Ceskoslovenska psychiatrie, no. 3, 1965, 172-175

TOPIC TAGS: social problem, psychiatry

ABSTRACT: The role of a psychiatrist in the fight against crime is discussed. The function of a psychiatrist acting as an expert during legal proceedings is to determine the motivation factors and the importance of mental disturbances and abnormalities such as sexual deviations, oligophrenias, and psychopathies. Possibilities of combining rehabilitation with punishment of criminals are discussed. The necessity to investigate the primary causes of criminal actions that frequently have their roots in childhood stresses is emphasized. [JPRS]

TITLE: Methods of hypnotic suggestion in the investigation of higher nervous activity in man [This paper was presented at the Third Interdisciplinary Conference on Experimental and Clinical Study of Higher Nervous Functions held in Marianske Lazne from 19 to 23 October 1964.]

SOURCE: Activitas nervosa superior, v. 7, no. 2, 1965, 185-186

TOPIC TAGS: man, psychiatry

ABSTRACT: Age-regression evoked by hypnotic suggestion is not of an actual regressive character; the patient acts by utilizing hypermnestic elements on the basis of preconception. The technique of hypnotic suggestion may be employed in various ways. Reproduction of a traumatizing experience, formation of new situations sufficient to provoke a trauma, provoking a behavior which is close to impossible, or by an overload of usually manageable stimuli. The subconscious factor of the patient can be controlled by the experimenter. Experiments connected with the feeling of pain are important. Influence may be exerted upon emotions, and upon somatic organs and organ systems. [JPRS]

(Paper and Printing -- Papír és Nyomtatás technika -- Vol.
4, 1952, No. 11, pp. 27--29, 2 figs.)

For making satisfactory half-tones, the ratio of the diameter of the diaphragm (D_d) to the extension (e) should equal the ratio of the diameter of the screen aperture (D_s) to the distance of the screen (s), i. e. $D_d : e = D_s : s$. Two devices may be used for this purpose. The Screen Distance Table issued by the Offset Printing Office has a slide gauge-like design and includes the necessary data for three different stops to each of four screen densities. It can be worked simply and rapidly. Horvai's diagrammatic device for screen distance and diaphragm determination permits readings of data for every possible screen density and diaphragm combination, even of values between markings on the diaphragm scale of the objective. Both devices work well and proved to be reliable in practice.

Title : On the Concentration Dependence of the Effect of Secondary
Fluorescence on the Spectra

Orig Pub : Acta phys. et chem. Szeged, 1956, 2, No 1-4, 9-17

Abstract : Using a photoelectric spectrophotometer, the authors have investigated the changes in the radiation spectra of fluorescein in water(pH = 12.5). When the concentration of the fluorescence changes, a shift in the radiation spectrum is observed, in spite of introducing corrections for the reabsorption. The authors ascribe this shift to the influence of the secondary fluorescence. The fluorescence spectrum, corrected also for secondary fluorescence by the method of Budo and Ketskemety (Referat Zhur Fizika, 1957, No 6, 15645), is independent of the concentration over a wide range (2×10^{-5} to 10^{-2} m/l).

KOERTEL, A.

The concentration dependence of the spectral effect of secondary fluorescence. M. Dogni and H. Koenig (U.S. Patent, June 1, 1960). Specification No. 2,475,616. Chem. (N. S.), 2, p-17 (1960) (in German).—The fluorescence spectra of fluoresceins salts, (pH 12.5) at 24° and at concns. from 10^{-4} to 10^{-1} were determined at wave lengths from 490 to 590 m μ in the app. described. One series of expts. was carried out at const. k (k = length of cell, c = concn. of soln.), another series at const. c . By comparing fluorescence spectra corrected for reabsorption, there was a spectral shift varying with concn., which could be explained by secondary fluorescence. The true spectra (corrected for secondary fluorescence as well as reabsorption) were independent of concn.

The spectral influence of secondary fluorescence. A.
Budo, J., Dombo, and R. Horvai (Univ. Szeged, Hung.)
Acta Univ. Szegedensis Acta Phys. et Chem. [N.S.] 3 & 16
(1957) (in German).—The differences, which arise solely due to the observational method in the case of primary fluorescence spectra, are nonexistent in the case of the quant. research including the effect of the secondary fluorescence spectra (at least for fluorescein solns.). Measurements were made for (1) longitudinal measurement on the middle of the front plane, (2) the same on the back plane, and (3) transverse measurements, each at 436 and 490 m μ . The max. divergence of the direct measured quantum spectra for $\lambda = 500$ -600 m μ was in the range 11-30%; for that only concerned with the reabsorption cor. spectra the max. divergence was 1.0-25%; and for that also cor. for the secondary fluorescence only 1.4-5.0%, i.e., the last divergence lies within the probable error ($\pm 3\%$) of the method. By varying the concn. and the layer thickness, the agreement was less good, but in all cases it was better than when just the influence of the reabsorption was considered. The mathematics for calcg. the different cases is included.

Marian C. Neumann

121. Oil production in the territory of Yugoslavia before the first world war. E. B. Horvath, Nafta (Yugoslavia), 1923, § (8), 250-60. - The fourth phase of the industry's development is described. This phase, beginning in 1907 and ending with the end of the first world war and with the creation of the new Yugoslav state, is characterized as a period of stagnation. There was no more drilling in Bosnia, and only at one place in Croatia (Veliki Pogorec); exploration ceased in Modrušnica too. The only attempt to begin anew with drilling operations was made in Modrušnica between 1911 and 1916 on Singer's claims, by an English-Hungarian oil syndicate, but with very little success. However, during the war, for war needs, the search for oil began anew, and in 1918 the first gas field in the country, Rujavica near Lipiz, was opened.

✓ 1869. Oil production in the territory of Yugoslavia before the first world war. B. Horvat. *Narodna Knjiga Jugoslavija*, April 1953, 4, 120-8.—The evolution of Yugoslavian oil and gas industry is not well known, but the industry has 100 years of history. The oil seepages on Yugoslavian territory were mentioned in 1788, and from this year dated Prof. Winter's descriptions of oil seepages near Peklenica in Međimurje. The farmers of Peklenica produced oil by digging trenches and collecting the seepage, which they used as medicine and car grease. In 1858 the oil producers got the first claims for oil production at Mikluška and Petrovo Selo in Croatia, but the actual history of the industry began in 1880 with first drilling for oil in Međimurje near old seepages. In this article the period up to 1900 is described. This period of development has 3 phases: the first, before 1884, represents phase of mining for oil; the second, 1885-89, when besides hand-dig wells, the first 15 drillings took place in various parts of the country in Međimurje, Croatia, and Bosnia; and the third phase from 1900 to 1906, when the first greater quantities of oil were produced. This production developed almost entirely on the Solinica field in Međimurje. The production from Međimurje fields, which started in 1880, still continues. (Author's Abstract.)

AUTHOR: Horvat, Ivan (Ivan Horvat)

TITLE: Temperature stabilization of the frequency of a transmitter drive oscillator using a bimetallic device

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 7, 1962, abstract 7-7-198 v (Elektrotehn. vestn. v. 28, no. 8-10, 1960, 193-196 [Sloven.; summaries in Ger., Eng., and Fr.])

TEXT: The paper shows the effectiveness of using a bimetal device for the temperature compensation of a variable inductor and a variable capacitor. Theory and practical methods of compensation by bimetal device, are described. The desirability of using a bimetal device is confirmed in all instances where high thermal and mechanical stability is required together with small weight and volume. The author considers the method of replacing one of the rotor plates of a capacitor by a bimetal plate, and a method of direct compensation of a variable choke and variable capacitor. The second method uses a shorted rim fitted directly onto the inductor and en-

closing a part of the magnetic flux; the rim weakens the flux, since it acts as the secondary winding of a RF transformer. The inductance varies when this rim is displaced with respect to the edge of the winding. The rim is fitted with a bimetal clamp in such a way that a deformation of the clamp due to temperature change forces the hoop either to approach the edge of the winding or to recede from it, producing the required negative coefficient. Continuous control of such compensation is automated, and achieved by using a very stable secondary quartz standard in a special circuit, where the control device is placed in a thermostat. A Franklin oscillator is used in the input to the thermostat to generate the oscillations used in the AC control circuit. 7 references. (Industrija za elektrouze, Yug.) Title : Electric Properties of Lumber

Orig Pub : Tehn. pregl., 1957, 9, No 3, 94-100

Abstract : A study is made of the electric specific conductivity, dielectric constant, the loss factor, and resistance at radio frequencies. It is shown that all these properties depend on the type of lumber, on the structure of the fibers, moisture contents, temperature, and frequency of the alternating field.

Title : The Synthesis of Isonicotinic Acid Hydrazide.

Orig Pub: Magyar kem. folyoirat, 1957, 63, No 10, 284-286.

Abstract: The synthesis of isonicotinic acid (I) and its hydrazide (II) from 4-ethyl pyridine (III) is described. Aluminum powder and iron filings in particular were successfully used instead of the conventional zinc dust for the synthesis of III (yield 33-38%). Two hundred grams of pyridine, 800 milliliters of acetic anhydride, 200 milliliters of glacial acetic acid and 100 grams of aluminum are heated (130°C., 3 hours), then at 115°C., 200 milliliters of acetic acid and 107 grams of

Card 1/4

16

HUNGARY / Organic Chemistry. Organic Synthesis.

G-2

Abs Jour: Ref Zhur-Khimiya, No 1, 1959, 1272.

Abstract: aluminum are added and boiled for an additional four hours. At 100°C. the contents are diluted with water, made alkaline to the phenolphthalein with sodium hydroxide and III is steam distilled; yield 42.6%. Under analogous conditions but using iron instead, the yield was 74.3%. The latter varies depending on different grades of iron in a 20% range (steel is better than cast iron; iron which has been reduced with hydrogen reacts badly). Oxidation of III to I in addition to KMnO₄ (yield 70%) was accomplished with SeO₂ and NaOCl. Five grams of III, 0.4 grams of SeO₂, 1.5 milliliters of water, 48 grams of concentrated sulfuric acid were heated for two hours at 280°C.; then 200 milliliters of water was added and the pH was adjusted to 3.6 and while boiling, a saturated solution

Card 2/4

HUNGARY / Organic Chemistry. Organic Synthesis.

G-2

Abs Jour: Ref Zhur-Khimiya, No 1, 1959, 1272.

Abstract: from CCl_4 extract by distillation at 4-5 millimeters, yield 94%. Upon oxidation with SeO_2 , the temperature may be raised to 310°C . after the evolution of gases stops, and after ~ 8 hours it can be raised to 325°C ., 114 grams of HOSO_2Cl is added to the alcoholic solution of the remainder, and by a further procedure, similarly to the one described above, there is obtained (without a preliminary separation of I) the ethyl ester of I (yield 84% based on III). II was obtained from the latter by a conventional method, m. p. $168-170^\circ\text{C}$.
