✓Thermodynamics of the processes taking place during the reduction of zinc oxide. I. Zoltán Horváth, Kémiatársi Lapok 90, 32-42 (1967).—Provided that the condensed phases are insol. in each other, the systems contg. O<sub>2</sub> in the gas phase only can be considered as univariant. If one addnl. gas or compd. is present, the system becomes bivariant and if 2 addnl. gases occur, it becomes trivariant. If the condensed phases are sol. in each other, the no. of variables is the sum of all gases and all dissolved components. II. Ibid. 112-19.—Four reactions take place: ZnO + C = Zn + CO (I), 2ZnO + C = 2Zn + CO<sub>2</sub> (II) ZnO + CO = Zn + CO<sub>2</sub> (III), and CO<sub>2</sub> + C = 2CO (IV). If these occur simultaneously, the equil. compn. of the product gas is Zn 50.37, CO 48.82, and CO<sub>2</sub> 0.79%. Study of the kinetics of the reaction indicates that III predominates. To avoid re-oxidation the p<sub>ZnO</sub>/p<sub>O<sub>2</sub></sub> ratio should be kept ~ 3000; to ensure this, a min. temp. of 1100° is needed at which the rate of IV greatly exceeds that of III. No re-oxidation takes place below 550°. Liquid Zn begins to appear at 1040° and 7.6 atm. The equil. const. of II is 1 at 997°; at this temp., the gas phase consists of 82% CO and 38% CO<sub>2</sub>. At 1 atm. total pressure and 0.5 atm. partial Zn vapor pressure I begins at 900, II at 950, and III at 900°; the respective temps., when starting from normal conditions, are 950, 1077, and 1510°. L. G. Arvai

"Kidney Clearance Tests With a Single Injection of Phenol Red, Without Urine Testing. II. Clinical Application."

Budapest, Magyar Allatorvosok Lapja, Vol 18, No 8, Aug 1963, pages 321-323.

Abstract: [Authors' English summary modified] Phenol red is the most suitable test of the kidney clearance in cattle, since concentration tests can not be used. Favorable results were obtained with this method in the testing of kidney function in otheranimal species as well. Cows with severe kidney impairment gave half-times ( $t_{1/2}$ ) between 40-75 minutes, In cases of lesser disease the half-time was 26-38 minutes. Similar results were obtained in horses and dogs. The values obtained were in agreement with the clinical and pathological findings in most of the cases and indicated the degree of affection in the kidneys correctly. No references.

HORVATH, Zoltan, Dr, professor, ROZSAHEGYI, Tibor, Dr, adjunctus; Veterinary Medical University, Department of Internal Medicine and Clinic (chairman: HORVATH, Zoltan, Dr, professor, cand. of vet. sci.) (Allatorvostudomanyi Egyetem, Belgyogyaszati Tanszek es Klinika).

"Current Principles of the Diagnosis and Treatment of Indigestio Præventriculorum I. Diagnosis."

Budapest, Magyar Allatorvosok Lapja, Vol 21, No 7, Jul 66, pages 289-296.

**Abstract:** [Authors' English summary modified] The procedure involved in the diagnosis of rumen inactivity is discussed including some complementary methods such as the examination of the rumen contents, the taking of ruminographic records and the use of a ferroscope. In addition to anamnestic data as well as general and detailed clinical examinations, the following conditions are also considered carefully when studying the etiology of the syndrome: fullness and gas content of the forestomach and the results of the rumen content examination (physical condition, pH, infusoria, sedimentation, gas production, cellulose digestion, nitrite binding ability, amount of volatile fatty acids). Special attention is paid to the ruminograms and to the results of feroscopic examinations. By feeding ensilage alfalfa to

"Investigation of the Reactivity of Carbon-Containing Substances"

Budapest, Kohászati Lapok, Vol 99, No 5, May 1966, pp 217-221.

Abstract: Among the characteristics determining the suitability of various coals for industrial purposes one of the most important one is reactivity. Means for determining the reactivity of coals were presented and discussed. It was shown that the Boudouard reaction,  $\text{CO}_2 + \text{C} = 2\text{CO}$ , provides the most suitable basis for this determination. The principles and techniques involved in determinations of reactivity on this basis were presented in some detail. The equations characterizing reactivity comprise the relationships between diffusion, grain size, reacting surface, gas pressure, and the like. Some examples were presented for the applications of the relationships discussed.

"General Veterinary Medical Training at the University of Veterinary Science"

Budapest, Magyar Állatorvosok Lapja, Vol 21, No 8, Aug 56; pp 368-371.

Abstract [Author's English summary, modified]: Authors report on the organization of the general veterinary practice of students, introduced at the University of Veterinary Science, Budapest, two years ago, and on the experiences acquired in this practice. Fourth- and fifth-year students, in groups of 6 or 7, call on state farms, cooperative farms, state veterinary stations not far from Budapest, during the first 4 days of each week, and carry out practical veterinary work under the direction of an instructor and in collaboration with the veterinary surgeon in charge. Some of these places are visited once every two weeks. The authors consider this practice and the experiences acquired during its course advantageous not only from the veterinary point of view, but also as a teaching tool. 29 References, mainly Western.

AUTHORS: Náter, Ivan; Horváthová, Soňa and Netschevá, Drahomila  
(Bratislava)

TITLE: The influence of inelastic internal resistance on  
the velocity of bending waves in elastic bars

PERIODICAL: Matematicko - fyzikálny časopis, no. 2, 1961, 131-145

TEXT: The mathematical investigation of wave velocity in elastic  
bars has been undertaken at several levels. The simplest theory,  
neglecting the internal resistance, has been given by G. Kol'skiy  
(Ref. 1: Volny napryazheniya v tverdykh telakh (Stress Waves in  
Solid Bodies) Moscow 1955 expressed in the differential equation

$$c_0^2 k^2 \frac{\partial^4 y}{\partial x^4} + \frac{\partial^2 y}{\partial t^2} = 0. \quad (1)$$

Kol'skiy is also quoted as having prepared graphs *[Abstracter's note: Not given in this paper]* which are compared with the results  
of the more exact theory given by Rayleigh (Ref. 2: Teoriya zvuka

Card 1/8

Z/045/61/000/002/001/001  
D231/D304

The influence of inelastic...

(Theory of Sound) Moscow-Leningrad 1940) and also by S. Timoshenko (Ref. 6: *Pružnost a pevnost*, Prague 1951) essentially in the form of equation

$$c_0^2 k^2 \frac{\partial^4 y}{\partial x^4} + \frac{\partial^2 y}{\partial t^2} - k^2 \frac{\partial^4 y}{\partial x^2 \partial t^2} = 0. \quad (4)$$

Taking the inelastic internal resistance into consideration the authors obtain equation

$$\left(1 + i \frac{\psi}{2\pi}\right) c_0^2 k^2 \frac{\partial^4 y}{\partial x^4} + \frac{\partial^2 y}{\partial t^2} = 0. \quad (14)$$

derived in accordance with Ref. 1 (Op. cit) and corresponding to Eq. (1) and if one proceeds according to Ref. 2 (Op. cit)

$$\left(1 + i \frac{\psi}{2\pi}\right) c_0^2 k^2 \frac{\partial^4 y}{\partial x^4} + \frac{\partial^2 y}{\partial t^2} - k^2 \frac{\partial^4 y}{\partial x^2 \partial t^2} = 0. \quad (19)$$

is obtained corresponding to Eq. (4); on solving the equation, the

Card 2/8

The influence of inelastic...

<sup>23145</sup>  
Z/045/61/000/002/001/001  
D231/D304

the authors obtain

$$\left[ 1 - \left( \frac{\psi}{2\pi} \right)^2 + 2i \frac{\psi}{2\pi} \right] c_0^2 k^2 \frac{\partial^4 y}{\partial x^4} + \left( 1 + i \frac{\psi}{2\pi} \right) \frac{\partial^2 y}{\partial t^2} - \left( 1 + i \frac{\psi}{2\pi} \right) k^2 \left( 1 + \frac{E}{\mu G} \right) \frac{\partial^4 y}{\partial x^4 \partial t^2} + \frac{k^2}{c_0^2} \frac{E}{\mu G} \frac{\partial^4 y}{\partial t^4} = 0. \quad (22)$$

the dependence of the velocity on the wavelength being expressed in

$$c = \frac{2\pi c_0 k}{\lambda} \sqrt{\frac{1}{2} \left[ 1 + \sqrt{1 + \left( \frac{\psi}{2\pi} \right)^2} \right]}. \quad (17)$$

$$c = c_0 \left[ 1 + \left( \frac{\lambda}{2\pi k} \right)^2 \right]^{-\frac{1}{2}} \sqrt{\frac{1}{2} \left[ 1 + \sqrt{1 + \left( \frac{\psi}{2\pi} \right)^2} \right]}. \quad (21)$$

Card 3/8

X  
23145

Z/045/61/000/002/001/001  
D231/D304

The influence of inelastic...

and

$$c = \frac{c_0}{\sqrt{2}} \sqrt{1 + \frac{\mu G}{E} \left[ 1 + \left( \frac{\lambda}{2\pi k} \right)^2 \right] - \sqrt{\left\{ 1 + \frac{\mu G}{E} \left[ 1 + \left( \frac{\lambda}{2\pi k} \right)^2 \right] \right\}^2 - 4 \frac{\mu G}{E}}. \quad (25)$$

$$\sqrt{\frac{1 - \frac{5}{4} \left( \frac{\psi}{2\pi} \right)^2}{1 - \frac{3}{2} \left( \frac{\psi}{2\pi} \right)^2 + \frac{1}{16} \left( \frac{\psi}{2\pi} \right)^4}}. \quad (25)$$

in accordance with Ye. S. Sorokin (Ref. 3: Metod ucheta neuprugogo soprotivleniya materiala pri raschete konstruktsiy na kolebaniya Sbornik TsNIPS, 1951), where

$$\sigma = \left( 1 + i \frac{\psi}{2\pi} \right) E \varepsilon, \quad (10) \text{ and } \tau = \left( 1 + i \frac{\psi}{2\pi} \right) G \gamma \quad (11)$$

In these expressions the inelastic internal resistance causes a slight increase in the wave velocity. According to Sorokin's new

Card 4/8

The influence of inelastic...

*23145*  
Z/045/61/000/002/001/001  
D231/D304

hypothesis (Ref. 12: K teorii vnutrennego treniya pri kolebaniyakh uprugikh sistem (On the Theory of Internal Friction During Oscillations of Elastic Systems) Moscow 1960),  $\sigma = (u + iv) E\varepsilon$  (10a)  
and  $\gamma = (u + iv) G\dot{\varepsilon}$  (11a)

where

$$u = \frac{1 - \left(\frac{\psi}{4\pi}\right)^2}{1 + \left(\frac{\psi}{4\pi}\right)^2}, \quad v = \frac{\frac{\psi}{2\pi}}{1 + \left(\frac{\psi}{4\pi}\right)^2}. \quad (12)$$

If one expresses the inelastic internal resistance according to this new theory as

$$(u + iv) c_0^2 k^2 \frac{\partial^4 y}{\partial x^4} + \frac{\partial^2 y}{\partial t^2} = 0. \quad (28)$$

$$(u + iv) c_0^2 k^2 \frac{\partial^4 y}{\partial x^4} + \frac{\partial^2 y}{\partial t^2} - k^2 \frac{\partial^4 y}{\partial x^2 \partial t^2} = 0. \quad (32)$$

Card 5/8

The influence of inelastic...

<sup>23145</sup>  
Z/045/61/000/002/001/001

and

$$(u + iv)^2 c_0^2 k^2 \frac{\partial^4 y}{\partial x^4} + (u + iv) \left[ \frac{\partial^2 y}{\partial t^2} - k^2 \left( 1 + \frac{E}{\mu G} \right) \frac{\partial^4 y}{\partial x^2 \partial t^2} \right] + \frac{k^2 E}{c_0^2 \mu G} \frac{\partial^4 y}{\partial t^4} = 0. \quad (35)$$

the dependent wave velocity is given by expressions

$$c = \frac{2\pi c_0 k}{\lambda} \left[ 1 + \left( \frac{\psi}{4\pi} \right)^2 \right]^{-\frac{1}{2}}. \quad (30)$$

$$c = c_0 \left[ 1 + \left( \frac{\lambda}{2\pi k} \right)^2 \right]^{-\frac{1}{2}} \cdot \left[ 1 + \left( \frac{\psi}{4\pi} \right)^2 \right]^{-\frac{1}{2}}. \quad (34)$$

and

$$c = \frac{c_0}{\sqrt{2}} \sqrt{1 + \frac{\mu G}{E} \left[ 1 + \left( \frac{\lambda}{2\pi k} \right)^2 \right]} - \sqrt{\left\{ 1 + \frac{\mu G}{E} \left[ 1 + \left( \frac{\lambda}{2\pi k} \right)^2 \right] \right\}^2 - 4 \frac{\mu G}{E}}. \quad (38)$$

Card 6/8

The influence of inelastic...

23145  
Z/045/61/000/002/001/001  
D231/D304

Here the inelastic internal resistance causes a decrease in the velocity. Taking a value of 0.2 for  $\psi$ , the correcting factor becomes according to Eq. (22) [Abstracter's note: Sorokin's old hypothesis]  $\pm 1.000\ 14$ ; comparing that with the result obtained according to the new hypothesis where one obtains the correcting factor  $\pm 0.999\ 987$ , it is clear that the decrease in velocity is only approximately 0.0013% of the speed; this value is practically negligible except in the case of materials with a high value of  $\psi$  (e.g. ferroconcrete). The author gives the following glossary of symbol values:  $\psi$  = coefficient of internal energy absorption;  $c_0 = \sqrt{\frac{E}{S}}$ ;  $E$  = modulus of elasticity (in tension);  $s$  = specific

mass of bar material;  $k = \sqrt{\frac{I}{S}}$ ;  $I$  = moment of inertia;  $S$  = sectional area of the bar;  $t$  = time;  $\epsilon$  = relative lengthening (under tension);  $\lambda$  = relative movement (under compression);  $x$  = right angle coordinate referring to the equilibrium position of the bar;  $y$  = deflection of single points from axis;  $G$  = modulus of elasticity (compression);  $c$  = wave velocity (bending waves);  $\sigma$  = normal stress;

Electrolysis of complex silver salt solutions. Tibor Erdéy-Gréz and Valéria Horváth (Univ., Budapest, Hung.). *Magyar Kém. Lapja* 4, 524-31 (1949).—A device was constructed for the purpose of scratching the surface of a silver electrode during electrolysis. This electrode was prep'd. from thick wire by hammering it into a disklike shape. Solns. contg. various amts. of  $\text{AgNO}_3$ ,  $\text{KAg}(\text{CN})_2$ , and  $\text{Ag}(\text{NH}_3)_2\text{OH}$  were electrolyzed and the mechanism of deposition of Ag on the cathode was studied. Gaseous N was bubbled through the solns. during electrolysis to inhibit the dissolving of Ag in the cyanide soln. The max. current -ds. were detd. at which the Ag pptn. on the cathode still agreed with the law of Faraday; these values are called "limits" or 100% Ag pptn. (110%). This limit was the highest in  $\text{AgNO}_3$  solns. as compared to other solns. of identical concn., and the lowest in solns. of  $\text{Ag}(\text{NH}_3)_2\text{OH}$ . A value of 110% increased parallel to the increase of Ag concn., but showed no alteration when  $\text{KNO}_3$  or  $\text{NH}_3\text{OH}$  was added to the soln. at a given Ag concn. The addn. of excess KCN to a soln. of  $\text{KAg}(\text{CN})_2$  diminished the value of 110%. Increasing the temp. in the interval 0-20° increased the value of 110% by about 1% for each degree centigrade. A correlation of the anodic-dissolving effect to the current d., similar to that of the cathode was observed. The numeric value of 110% appeared somewhat higher for the anode. The presence of  $\text{KNO}_3$ , KCN, and  $\text{NH}_3\text{OH}$  increased the value of anodic 110%. The results of expts. show no significant differences between electrolytic pptn. of Ag from Ag ion hydrates present in simple solns. of Ag salts and

electrolytic pptn. of Ag from complex ion solns. The mechanism of the process is the following: The ions are send. from the soln. by the force of the cathodic field, then they go to the surface of cathode, where they are neutralized. The Ag lost from the soln. by this prtn. is replaced by diffusion. The ion transfer due to the elec. current does not play a significant role in this respect. Calcu. based on these principles showed that the thickness of the layer between the surface of the cathode and the interior of the soln. must be about  $10^{-3}$  cm. This is in accordance with results obtained in other fields. Diffusion actually transfers Ag in amts. corresponding to the cathodic current d., up to the 110% values. In the case of current d.s. above this rate, the diffusion is unable to replace the full amt. of Ag required. Existence of anodic dissolving effects below 100% is probably due to a layer covering the surface of the anode with solid salts. It seems that this layer forms when the velocity of Ag soln. becomes greater than the velocity of diffusion between the produced salt and that portion of the soln. which is in immediate contact with the surface of anode, and the latter thus becomes oversat'd. in respect to Ag compds.

Abstract: A colorimetric method of determination of active substances in preparations containing chloropromazine (I) [Largactyl, megaphene, hibernal (aminozin In USSR)] was developed. It is based on the color reaction of I with Fe<sup>3+</sup> chloride in a hydrochloric medium. The conditions, under which I can be detected in con-

Antibiotics!

Abs Jour: Ref Zhur-Khimiya; No 18, 1958, 61966.

Abstract: Concentrations from 100 to 400 µ in 25 ml, were determined experimentally. It was found contrarily to bibliographic data that the red colored reaction product was not an oxidation product, but consisted of a Fe<sup>3+</sup> complex. The unsplit active substance can be easily determined in the presence of dissociation products.

Raney nickel catalyzed alkylation of aromatic amines with  
alcohols Jiroslav Horváth and Ondřej Černý (Výzkumný  
Ústav naftového průmyslu, Pardubice, P. R. ČSR) *[Signature]*

Zluty 30, 381-6 (1966) - Raney Ni was found a suitable catalyst for alkylation of aromatic amines with alcohols. Compared with acid-catalyzed alkylations, Raney Ni-catalyzed alkylation favors the formation of secondary amines and shows less corrosive action. The alkylation was carried out either under atm. pressure the reaction water being removed by azeotropic distil., or by heating a mixt. of the amine, alcohol and catalyst in an autoclave. The yields of the secondary amines ranged from 38 to 72%. A mixt. of 29.8 g.  $\text{Ph}_2\text{NH}_2$  (1), 248.5 g. abs.  $\text{EtOH}$ , and 8.05 g. Raney Ni (II) was heated in a stainless autoclave 8 hrs. at 220° (pressure 130 atm.). It was removed by filtration, the filtrate

Aromatic N-monosubstituted amines or N,N-disubstituted diamines by alkylation of primary aromatic amines with alcohols. Jaroslav Horváta, Otakar Černý, and Václav Hanousek. Czech. 87,381, Oct. 18, 1957. Heating in an autoclave 2.16 moles PhNH<sub>2</sub> (I), 5.40 moles abs. EtOH, and 5.05 g. Raney Ni (II) 6 hrs. to 220°, filtering, and distg. the mixt. gives 2.1% unreacted PhNH<sub>2</sub>, 71.8% PhNHEt (III), and 10.6% PhNEt<sub>2</sub>. Analogously is obtained 89.0% p-Bu-NHC<sub>2</sub>H<sub>5</sub>NHBu. An alternative method consists of heating 1 mole I, 12.0 g. EtOH, and 11.0 g. II 16 hrs. to 160° with removal of H<sub>2</sub>O yielding 8.4% I and 65.1% III. Similarly is obtained 71.5% PhNHBu.

TITLE: On the Relationship Between the Dissociation  
Constant and the Solubility of Organic Sulfo-  
acids and the Acidity Functions  
ORIG. PUB.: Chem Listy, 52, No 7, 1201-1205 (1958)

ABSTRACT: The author proposes the determination of the  
first and second order dissociation constants of  
aromatic acids by the use of solubility data at  
known values of the acidity function  $H_0$ . Equa-  
tions have been derived giving the dependence of  
 $\log(S/S_0 - 1)$  on  $H_0$ , where  $S_0$  is the concentration  
of undissociated acid  $ArSO_3H$  and  $S$  is the sum of  
the concentrations of  $ArSO_3^-$  and  $ArSO_3H$ . The  
inflection point in the  $\log(S/S_0 - 1)$  vs.  $H_0$   
curve corresponds to the dissociation constant.

HOR YNA, J.

✓ Relation between the solubility, the degree of acidity of the medium, and the dissociation constants of 1,5-naphthalenedisulfonic acid and 1,5 and 1,8-anthraquinonedisulfonic acids. J. Horyna (Výzkumný ústav organických syntet., Pardubice-Rybíček, Czech.). Collection Československé chem. Commun., 24, 2037-41 (1950).—From the solv. of the 1,5-naphthalenedisulfonic acid (I), 1,5-(II), and 1,8-anthraquinonedisulfonic acids (III) their dissociation consts. were computed graphically. The values of  $pK_{a,10^{\circ}C}$  and  $pK_{a,20^{\circ}C}$  are: I -3.58, -0.47; II -3.95, -6.03; III -2.38, -3.00. The effect of change in the degree of acidity of the medium on the solv.  $S$  of the aromatic sulfonic acids can be expressed by the relations:  $\log(S^1/S^2) \approx -\Delta H$ , and  $\log(S^1/S^2) \approx -\Delta H_s$ .
