Bondaryuk, Mikhail Makarovich and Il'yashenko, Sergey Mikhaylovich

Pryamotochnye vozduшno-reaktivnye dvigateli (Ramjet Engines) Moscow,  
Oborongiz, 1958. 391 p. 10,000 copies printed.

Ed. of Publishing House: Petrova, I. A.; Tech. Ed.: Rozhin, V. P.; Reviewer:  
Shchetinkov, Ye. S., Doctor of Technical Sciences, Professor; Ed.:  
Makurov, B. V., Engineer; Managing Ed.: Sokolov, A. I.

PURPOSE: This book is intended for engineers, specialists in aircraft-engine  
design and for students of aviation vuzes who are acquainted with basic  
thermodynamics and gas dynamics.

COVERAGE: The authors state that this book is the first attempt at a  
generalized compilation of information indispensable for understanding the  
physical processes of ramjet engines (hereafter abbreviated RJE) and also  
for analysis of their gas dynamics and thrust. Source materials for this  
book included monographs and periodical articles in Soviet and foreign  
technical publications, and also some research work of the authors.

Card 1/17

## Ramjet Engines

585

combustion process, chambers may be subdivided into single-shell and double-shell types. Both kinds may be of a vortex or stable-flow type. The authors also mention electrical and compression ignition, jet-swirl and pneumatic injection, and progressive and instant mixing. There are 19 references, of which 9 are Soviet (including 3 translations) and 10 are English.

In Chapter IX, "Subsonic RJE's," the authors describe the essential features of a subsonic RJE, and define its efficiency (7 percent) on the basis of the maximum obtainable intake pressure in a subsonic flight (1.89 times the atmospheric pressure). They give a method of analysis of these engines by successive approximations, and a method of computation of thrust characteristics of a real engine. They describe the most economical operating conditions and the speed and altitude characteristics of subsonic RJE's. They also mention various applications of subsonic RJE's. There are 14 references, of which 4 are Soviet and 10 English.

Chapter X, concerns "Supersonic RJE's." With modern fuels or atomic power the speed of continuous flight will be limited by the heat resistance of materials. At speeds of  $M > 6$ , the temperature from friction is higher than the melting point of steels. At  $M \approx 4$ , the specific consumption of fuel of a supersonic RJE is lower and the efficiency higher (more than 40 percent) than for any other type of engine. Various applications of supersonic RJE's are

Card 5/17

## Ramjet Engines

585

variable-area nozzles. There is no possibility of improvement of fixed-area nozzles. Engines working in various operating conditions must be provided with variable-area nozzles. The large store of energy accumulated in the ionized gas of the ionosphere may eventually be utilized in RJE's by means of a catalyst or by other devices. The authors mention the Soviet scientist Ya. B. Zel'dovich, who works in this field. The authors consider nuclear reactors for RJE's an immediate problem, and radioactive isotopes are mentioned as a possible source of energy. Beta batteries using artificial radioactive isotopes and producing electrical energy directly by radioactive decomposition are also mentioned as a potential source of energy for RJE's. At the end of the book 5 graphs of gasdynamic functions are given:

1.  $\tau(\lambda) = 1 - \frac{k-1}{k+1} \lambda^2$
2.  $\pi(\lambda) = [\tau(\lambda)]^{\frac{k}{k-1}}$
3.  $\varepsilon(\lambda) = [\tau(\lambda)]^{\frac{1}{k-1}}$
4.  $q(\lambda) = \lambda \varepsilon(\lambda) = \lambda(1 - \frac{k-1}{k+1} \lambda^2)^{\frac{1}{k-1}}$
5.  $z(\lambda) = \lambda + \frac{1}{\lambda}$

and 5 entropy diagrams of dissociated combustion products of kerosene. The authors mention the following scientists responsible for elaboration of the supersonic RJE theory: S. F. Abramovich, B. S. Stechkin, and Zhayev. In other fields Ye. S. Shchetinkov, G. I. Petrov, E. P. Ukhov, and I. A. Merkulov are mentioned.

On the Spray-Pattern of the Liquid Fuel Swirl Atomizers

kinetic pressures the length of the fully preserved position of the film increases as the air pressure decreases. At higher relative speeds of fuel or at higher pressures of the medium, the aerodynamic forces acting on the film are large and the process of disintegration of the fuel film begins immediately behind the orifice without the assistance of the capillary waves. As the pressure increases, the aerodynamic forces increase as well and the atomization becomes finer. Thus, as the pressure is increased the mean diameter of droplets at first increases, reaches a maximum (the lower the relative velocity of fuel the higher the pressure at which this maximum is reached) and then begins to decrease. The relative velocities of fuel as practised in combustion chambers are rather high, hence the higher the air density the better is the atomization. On the basis of the experimental results obtained by various investigators, the author succeeded in deriving an empirical relation of Eq (1.1) to (1.3) of which Eq (1) gives the medium diameter of droplets, Eq (1.2) the weight rate of production of droplets and Eq (1.3) the parameter of the

Card 2/4

S/147/60/000/02/010/020  
E022/8407

On the Spray-Pattern of the Liquid Fuel Swirl Atomizers

effectiveness of atomization. This parameter depends on the nature of the temperature of the fuel used, as shown in Fig 2, which agrees well with Ref 7. Next the flow of fuel from a swirl atomizer placed against the air stream (Fig 1) is analysed using the findings of Ref 11 to 13. The result is Eq (2.11) giving the range of extension of the spray. As the air pressure is increased atomization improves, droplets slow down quicker and the range of the spray diminishes. As the air temperature increases its density diminishes, hence the atomization is worse and the range of the spray increases. But as the fuel temperature is increased, its density, viscosity and surface tension diminish, atomization improves and the range of the spray decreases. As the pressure in the fuel system increases, the initial velocity of the fuel increases, atomization improves and the range of the spray decreases in spite of high initial velocity of the droplets. By increasing the diameter of the orifice of the atomizer or by reducing the swirl of the fuel, atomization becomes worse and the

Card 3/4

SC

S/147/60/000/02/010/020  
E022/E407

On the Spray-Pattern of the Liquid Fuel Swirl Atomizers

range of the spray increases. The shape of the spray in the absence of rotation ( $\omega = 0$ ) was analysed in Ref 14. The velocity and the coordinates of the trajectories of the droplets are as given by Eq (2.12) to (2.14); from the last relation, the author deduces the value of the limiting transverse radius of the spray as given by Eq (2.16). The effect of various parameters on this limiting transverse radius is shown in Fig 5 to 8 and the graphs show good agreement with the experimental results obtained by various investigators. Fig 5 shows the effect of fuel pressure; Fig 6 the effect of the air velocity; Fig 7 the effect of the fuel temperature and Fig 8 the effect of the fuel pressure and of the orifice diameter. There are 8 figures and 14 references, 8 of which are Soviet and 6 English.

Spray Torches of Centrifugal Atomisers (Part II)

concentration of the fuel diminishes. Referring to earlier experiments, summarised by Abramovich, G.N. ("Turbulent Free Jet of Liquids and Gases" Energoizdat, Moscow-Leningrad, 1948), the axial concentrations of admixtures to a turbulent jet are inversely proportional, whilst its radius is directly proportional to the length of the base section. In order to ignite a non-vapourising torch in the wake of the atomiser, a stabiliser must be arranged. Burning can be maintained until the mixture impinging on the stabiliser does not exceed the separation limit. Referring to earlier literature, it is shown that the separation limits can be satisfactorily predicted for relatively large atomisers. There are 8 figures and 7 references: 5 Soviet and 2 English.

AUTHOR: Il'yashenko, S. M., (Moscow)

TITLE: Evaporation and Combustion of a Monopropellant  
in the Chamber of a Liquid Fuelled Rocket EnginePERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy,  
Aviatsionnaya tekhnika, 1960, No. 4, pp. 72-82

TEXT: On the basis of three assumptions: (1) the evaporation of liquid fuel is the limiting process determining the kinetics of combustion, the parameters of the chamber, and its size; (2) the temperature of the combustion products is constant along all lengths of the chamber; (3) the evaporation of liquid fuel occurs from one end to the other at a gradually diminishing velocity such that the drops are subjected to an acceleration near to that of the gas, a mathematical analysis is made of the evaporation and combustion of fuel drops in the combustion chamber. Relations are derived and are shown graphically between the chamber parameters and length of the combustion zone, and between the chamber parameters and time of combustion of single component liquid fuel. The following conclusions are drawn: (1)

Card 1/3

S/147/60/000/004/008/016  
E081/E235

Evaporation and Combustion of a Monopropellant in the Chamber of  
a Liquid Fuelled Rocket Engine

On improved atomisation, that is on decreasing the mean Sauter diameter (Abstracter's note: "Sauter" diameter, not defined in the paper) of the drops, the length of the combustion zone of single-component or pre-mixed fuel in the combustion chamber decreases. If the drops are very small (diameter < 30 microns), the evaporation velocity becomes larger than the mass velocity of micro-diffusional turbulent combustion and the theory ceases to approximate to the truth. (2) With increasing growth of gas temperature on combustion, that is with increasing heat productivity of the fuel, the evaporation and combustion velocities increase according to a logarithmic law, but combustion time and the required length of chamber both decrease. (3) With increasing mass flow of liquid fuel and thermal conductivity of the gases, the evaporation and combustion velocities increase, but with the growth of heat capacity and viscosity of the gases, and density of the fuel, they decrease. (4) The calculated length of the evaporation combustion zones of drops of single-component

Title : Effect of Vacuum on Sorption of Dyes by Fibers

Orig Pub: Kolloid. zh., 1956, 18, No 5, 562-565

Abstract: In a specially designed apparatus a study was made of the sorption of dyestuffs (D) by fibers, in vacuum. It is shown that under conditions of a vacuum the sorption proceeds much more rapidly than under ordinary conditions, while the equilibrium state is the same in both instances. Experiments confirm the point of view of the authors, to the effect that under ordinary conditions the fibrous material contains air in sorbed and inclosed condition and therefore penetration of D inside the fiber is determined by competition of the molecules of air and D for space at the surface of the sor-

PERIODICAL: Tr. Nauch. sessii Vses. n.-i. in-t okhrany truda (Transactions  
of the Scientific Session of the All-Union Scientific-Research Labor-  
Protection Institute), 1954, Nr 3, Leningrad, 1955, pp 82-102

ABSTRACT: The Leningrad Labor-Protection Institute (LIOT) has developed  
instruments for measuring and analyzing noise. In 1949, a noise meter was  
developed known as "ShLIOT with a loudness scale." Its noise-measuring  
range is: intensity level, 35 to 130 db; volume, 35 to 130 phons; loudness  
in natural-scale units, 0.5 to 5,000. The noise meter is battery supplied.  
Its weight is about 8 kg, and it is convenient and reliable in operation.  
It can be used for measuring mechanical vibration by means of a piezo-  
electric vibration pickup. In 1953, another noise meter was developed  
known as "Inspektoratskiy ShI-53" (Inspector-type ShI-53). (In 1956, it  
will be manufactured by the industry as type ShI-1.) This noise meter

TITLE: New Instrument for Noise Frequency Analysis

PERIODICAL: Byul. naukno-tekhn. inform. po otkrane tryda, 1958, Nr 1, pp 53 - 62

ABSTRACT: The author describes a noise analyzer of the ASH-2-LION type with 1/3-octave bands. A cut of the filter frequency characteristics is 60 db per octave. The instrument is provided with a semi-automatic filter switch controlled by one hand, as well as a frequency scale with range brightening. The dimensions of the analyzer are as follows: 333 x 216 x 165 mm; weight: 8 kg. The pointer indicator has a dynamic range of 30 db. The author submits diagrams and photographs of the instrument as a whole and of its components. (NTI otkrany Truda VTsSPS, Leningrad, USSR). ✓

AUTHOR: Il'yashuk, Yu. M.

TITLE: Dynamic characteristics of noise frequency spectrum analyzers

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika, no. 1, 1962, abstract 1-7-55d (Sb. nauchni. rabot intov okhrany truda VTeSPS, 1960, no. 3, 72-79)

TEXT: The analysis of frequency spectra of noise by means of narrow band, manually tuned analyzers is cumbersome and of dubious value. Because of this the normally used analyzers work in conjunction with automatic recorders. In order to have a constant spectrogram scale the rates of revolution of the analyzer tuning shaft and that of the shaft of the tape moving mechanism are synchronized. The frequency characteristics obtained with continuous analyzer tuning are determined not only by the filter parameters, but also on the speed of the analysis. Such a characteristic, called dynamic, may differ considerably from the static one. The effect of

Card 1/2

Dynamic characteristics of ...

S/194/62/000/001/050/066  
D201/D305

special features of instruments on the speed of analysis is considered and a rational system of mechanical drive of automatic analyzers is given: The analyzer and recorder shafts are connected by a normal transmission and this coupled system is revolved at a varying speed by a reduction gear having a continuously varying ratio or by a controlled speed motor. The analysis time of such an analyzer is minimum and remains constant within the whole of the operating range. 3 references. / Abstracter's note: Complete translation.

"Investigation of Methods for the Measurement of Commercial Noise and Ways of Improving the Quality" Dissertation for the Degree of Candidate of Sciences, Leningrad Electrotechnic Inst. of Communication im. M. A. Bauch-Bruyevich. Defense held on 10 May 1962.

A classification for noise is defined, and errors in the measurement of noise level are determined. Features of different types of frequency analyzers are considered. It is shown that for identical tolerances for the discrepancy between the dynamic and static characteristics of a narrow-band analyzer, the greatest speed of analysis can be obtained in a heterodyne analyzer with linear frequency scale.

TITLE: Exchange of Experience - Experience in Using Liquid Nitrogenous Fertilizers (Obmen opytom. Opyt primeneniya zhidkikh azotnykh udobreniy)

PERIODICAL: Khimicheskaya promyshlennost', 1958, Nr 8, pp 492 - 494 (USSR)

ABSTRACT: In several Republics of the USSR, as in Uzbekistan and Kazakhstan, tests were started in the spring of 1956 on the use of liquid fertilizers. The UzSSR and KazSSR intended to use liquid ammonia and the ammoniate "A" ( $\text{NH}_4\text{NO}_3$ , 64-67%,  $\text{NH}_3$  14 - 17%,  $\text{H}_2\text{O}$  16 - 22%,  $\text{N}_2$  total 34-37%) on cotton plantations of an area of 5000 hectares. The Kombinat referred to in the Association was responsible both for the production and the technical aspects of the transportation of the liquid nitrogenous fertilizer. Ammonia tanks ATs-150 (on the chassis of the truck ZIS-150 with 2 cu.m.capacity,

Card 1/3

Exchange of Experience - Experience in Using Liquid  
Nitrogenous Fertilizers 30V/64-50-8-10/19

1350 kg ammonia, weight 1300 kg, 20 atmospheres) and the mobile tank ATsA-63 (on the chassis of a GAZ-63 truck; 2 cu. m., 2 t ammonium, 2 atmospheres) were used, the latter for ammonium. Both types showed a few shortcomings. The spraying of ammonium was done by a Soviet machine PUA-1 and imported American machines. The former proved to be more efficient, though the tanks were too small. The results of tests conducted to establish the amount of energy needed for distributing liquid fertilizer (Table 1) and the effects of fertilizing (Table 2) are given in the article. Apart from the savings in the number of workers effected by the use of liquid fertilizers instead of ammonium nitrate (0.2 - 0.3 workers per day instead of 0.7), a further saving of 40 roubles per hectare is possible, as was found by the Ministerstvo sel'skogo khozyaystva respubliki (Ministry of Agriculture of the Republic). The cost price of 1 kg of nitrogen in the form of ammonia is 35% lower than with ammonium nitrate. According to the GINP, capital investment for the construction of a 100000 t annual capacity ammonia plant is 100-110 million rbl. lower than for a similar

Card 2/3

Exchange of Experience - Experience in Using Liquid  
Nitrogenous Fertilizers

SCV/64-38-3-10/19

ammonium nitrate manufacturing plant. In 1957 experiments with liquid fertilizers were expanded considerably; gasoline tanks ATs-3800 were used for transporting ammonia and ammoniate. Moreover, the American machines mentioned above were modified. There are 3 tables.

IL'YASOV, A. T.

USSR/Hydrology - Infiltration

1 JUL 51

"Infiltration of Melted Waters Under Conditions of  
Chernozem and Podzol Soils," A. T. Il'yasov, Kazan  
Affiliate, Acad Sci USSR

"Dok Ak Nauk SSSR" Vol LXXXIX, No 1, pp 61-64

Water infiltration depends mainly on nature of soil.  
As example, data on Meshi River (podzol) and Stepnoy  
Zay River (chernozem) are compiled. Graphs for both  
regions are drawn based on the eq. melted water  
snow water - water losses. Presented by Acad I. I.  
Prasolov 3 May 51.
