was determined by calculating the difference between the number of colonies on the first and second plates and determining the percentage of this difference in relation to the number of colonies on the first plate. Thus, for example, the bactericidal index of the skin of rabbits given a daily dose of 0.05 mg of metachlorophenylisocyanate per kg body weight for 6 months was 38.9% as compared with 68.7% for healthy controls. Statistical processing of the findings demonstrated that the bactericidal property of the skin decreases with increasing dosage of sevin or metachlorophenylisocyanate. The bactericidal index may be recommended as an indicator of the immunobiological state of animals in sanitary-toxicological studies. Orig. art. has: 1 figure and 1 table. [JPRS]

TITLE: A converter of short time intervals with increased linearity

25

SOURCE: Ref. zh. Fizika, Abs. 12A309

REF SOURCE: Tr. 6-y Nauchno-tekhn. konferentsii po yadern. radioelektron. T. 2. M., Atomizdat, 1965, 15-19

TOPIC TAGS: analog digital converter, pulse code modulation, trigger circuit, tunnel diode

ABSTRACT: The authors describe a converter of short time intervals into a digital code, ensuring an increased linearity and at the same time sufficiently simple circuitry. The converter has no prior "stretching" of short time intervals. The time interval is measured directly by comparison with a number of cycles of oscillations of a known frequency. This method is widely used in microsecond devices, but owing to the lack of reliable high-speed trigger circuits, counting devices, etc., it could not be adopted for the nanosecond region. Such a possibility has been uncovered by the appearance of tunnel diodes with sufficiently high speed. The reference frequency is chosen to be 100 Mcs. To reduce a time channel up to 5 nsec by a factor of 2 compared with the period of the reference series, a special additional device is introduced into the converter circuit. The complete schematic diagram of the converter and different time diagrams illustrating its operation are presented. L. S. [Translation of abstract]

TITLE: Time-digital-code converter for nanosecond range

SOURCE: Pribory i tekhnika eksperimenta, no. 1, 1966, 111-114

TOPIC TAGS: nanosecond pulse, time digital code converter

ABSTRACT: As the existing analog time-pulse-height-time converters are inadequate for the purposes of modern experimental physics, a new non-analog converter has been developed. It uses the well-known principle of measuring a time interval by counting the number of pulses whose repetition rate is exactly known. A repetition rate of 200 Mc has been selected, which gives a time resolution of 5 nsec. The tunnel-diode counter capacity is 2^8 , i. e., the maximum measurable time interval is 1.28 microsec. The differential nonlinearity of the converter is $\pm 0.4\%$ or lower. The converter has been used under laboratory conditions for about 6 months. Reducing its resolution time to 1 nsec is held possible. A principal circuit of the converter is explained. Orig. art. has: 1 figure. [03]

TITLE: Neutron transit-time spectrometer

SOURCE: Pribory i tekhnika eksperimenta, no. 1, 1966, 53-61

TOPIC TAGS: spectrometer, neutron spectrometer

ABSTRACT: A new fast-neutron transit-time spectrometer is described which can measure a neutron spectrum from 100 kev to 14 Mev. Monochromatic 14-Mev neutrons are produced by a $T^3(d, n)He^4$ reaction; deuteron energy, 250 kev; deuteron-pulse duration, 7 nsec; beam interruption before acceleration is used (sketch supplied). The neutron detector and electronic equipment are briefly described. The spectrometer resolution determined from a 6-peak is 4 nsec/m; channel width, 2.12 nsec; integral nonlinearity, 0.2%. From a time-to-pulse-height converter, the signals are fed to a 256-channel analyzer. The resolution time is 8 nsec; transit base, 2 m; linear dynamic range, 400 nsec. The photomultiplier is equipped with a noise-elimination device, and the detector is well protected from the background noise,

TITLE: A Variable Transformer Circuit for Phase Shifting Within the Limits of 2π

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiotekhnika,
1959, Vol 2, Nr 4, pp 431-436 (USSR)

ABSTRACT: The authors discuss a phase shifter circuit with a VTM variable transformer, which provides a continuous phase shift within the limits of 2π , linearly depending on the angle of rotation of the transformer rotor. The errors are determined, caused by inaccurate selection of the circuit parameters and by changes in the signal frequency. Recommendations are given for eliminating these errors. The dependences are derived for the relative change of the amplitude of the output signal, depending on the angle of rotation of the transformer rotor. The circuit arrangement with a VTM variable transformer is considerably simpler in tuning and produces less errors than the circuit arrangement where

Pedagogical Sciences RSFSR, 1955, 55-85

Abstract : The value of experiments designed to increase the interest of the students is established. Examples are cited to show the methodical measures with which the teacher gains the active participation of all students not only in the process of making observations but also in the interpretation of these observations. It is most important systematically to get the students to explain the phenomena observed and to guide the students toward independent judgment and conclusions on the basis of the analysis of observations.

TITLE: Roller Guides in a 250 Wire Mill (Relikovyye propuski
na provlochnom stane 250)

PERIODICAL: Metallurg, 1958, Nr 5, pp 28 - 30 (USSR).

ABSTRACT: Roller instead of slip guides have been successfully used for the last five years when rolling 30-65 mm dia. rounds. The advantages of roller guides are outlined by the authors who discuss the difficulties which arose through high rolling speeds when such guides were used with 5-8 mm dia. wire. At the "Serp i Molot" Works, the 250 wire mill is used to roll low-carbon, medium carbon, tool (U7 - U13), austenitic and ferritic stainless (type 1Kh18N9T, "furrodit"), heat-resisting, high-speed and other steels into coiled 5.25-12.0 mm dia. wire. A fairly satisfactory slip guide was developed at the works jointly with the Moskovskiy institut stal' (Moscow Steel Institute) in 1954 but this still gave a defective product and a roller guide (Figures 1, 2) was constructed. This has one pair of rollers, is quickly and easily mounted and demounted and has some interchangeable bearings. For ease of passing the strip into the rollers and protecting the latter tubular cone guides are provided made,

Card1/2

Roller Guides on a 250 Wire Mill

like the rollers, of chromium-nickel-vanadium steel (1.8-2.2% C, 0.8-1.2% Mn, 0.5-1.0% Si, 23-25% Cr, 1.5-2.0% Ni, 1.0-1.3% W, 0.3-0.6% V, under 0.045% S and under 0.05% P. Two cone guides in series are provided, the feed-end one being held in position with a wedge which facilitates the clearing of cobbles. This type of guide the authors recommend both with manual and repeater operation. On the 450 and 300 mills at the works, guides with two pairs of rollers (Figure 4) are used but they have not proved satisfactory, whereas the one-pair types gave good results even when deliberately mis-aligned. The durability of a pair of rollers is up to 40-45 and 18-20 shifts on the Nr 2 and 3 lines, respectively, of the 250 mill. There are 4 figures.

TITLE: Some New Data on the Salt Content Along the South-
eastern Border of the Siberian Platform (Nekotoryye
novyye dannyye o solenosnosti yugo- vostochnoy okrainy
Sibirskoy platformy)

PERIODICAL: Materialy Vses. n.-i. in-ta, 1956, Nr 8, pp 268-281.

ABSTRACT: Twenty deep rotary drill holes between the Angara and
Lena Rivers uncover Cambrian saliferous deposits. The
basin contains thick sedimentary sequences of Qua-
ternary, Mesozoic, and Paleozoic age resting on the
crystalline basement. The Upper Cambrian deposits, the
Upper Lena series, consist of red and variegated marls
and layers of sandy marls and sandstones, with abundant
gypsum, especially in the lower part. The sequence
ranges in thickness from 10 m to 200 m and more.

Card 1/4

15-57-1-751

Some New Data on the Salt Content Along the Southeastern (Cont.)

Middle Cambrian rocks are generally absent. The Lower Cambrian, the Belaya and Angara series, consists of a carbonate sequence: dolomites, dolomitized limestones, marls, anhydrite-dolomites, occasional sandstones. Gypsum is characteristically abundant. The thickness of the sequence is 800 m to 1000 m and more. Below this sequence occur saliferous beds: alternations of rock salt, anhydrite-dolomite, dolomite, anhydrite, occasional sandstone. Two interbeds of diabase are found in the Zhigalovo (6 m thick) and the Ust'-Kut (68 m thick) regions. The thickness of the salt layers ranges from a fraction of a meter to tens of meters, locally to as much as 100 m to 140 m and more. The total thickness of this sequence ranges from 348 m to 1092 m. The proportion of salt in the beds ranges from 37 to 72 percent, averaging 60 to 65 percent. The thickness of the sequence ranges from 50 m or 60 m along the southeastern border of the platform to 1500 m or 1600 m to the northeast. Below this sequence occur the Moty and Ushakovka series (Cambrian), salt-bearing anhydrite-marl-dolomite rocks in the upper part, and variegated sandstones, siltstones, and mudstones in the lower part. The total thickness of this sequence is 738 m. The Card 2/4

15-57-1-751

Some New Data on the Salt Content Along the Southeastern (Cont.)

base of the salt-bearing sequence becomes lower to the northeast. Rock salt (81.1 to 98.5 percent NaCl and 0.7 to 9.6 percent gypsum) forms an entire series of varieties of different colors, textures, and structures. Gray salt is most abundant, but in the lower and upper horizons red is dominant. Admixtures in the halite include sylvite, clay material, anhydrite, authigenic quartz, carbonates of the dolomite-ankerite series, and occasional magnesite. At a depth of 1233 m in the core of the Tyret' drill hole, borate with radiating structure occurs in aggregates. The aggregates are white, the crystals colorless and transparent. The optical properties are $2V = +46^\circ$, $Ng = 1.670$, and $Np = 1.637$. The composition (in percent) is CaO 29.77, SrO 1.94, MgO 2.14, Na₂O 3.50, B₂O₃ 13.36, SO₃ 2.38, Cl 5.13, H₂O 6.85, CO₂ 4.76, H. o. (sic) 0.54, R₂O₃ 0.36; total 100.70. It is stated that NaCl, CaCl₂, MgCO₃, and CaSO₄ constitute 23.5 percent of the admixture. The mineral is similar to "kurganitaite."

V. D. K.

Editor's note: A misprint appears in the optical data of the

CONTENTS: This collection of reports was presented at the United Scientific Session on Metallogeny and Postulated Ore Occurrences in Kazakhstan. December, 1958. The reports concern various aspects of compiling metallogenic and ore occurrence maps as well as the methodology and techniques of correlating geological exploration data. These reports deal only with non-ferrous metals. Three other reports delivered at the conference but not included in this work were read by Ye. Ye. Zhdanov, N. D. Shatashvili, and Yu. K. Gorobetsky. References accompany each article.

| PROCESSES AND PROPERTIES INDEX | |
| The action of aromatic diaro compounds on compounds of the type of alkylacetoceto esters as a method for the synthesis of arylhydrazones of α -keto acids and α -amino acids. IX. The reaction of cyclohexanone-2-carboxylic acid ester with dianisobenzene. V. V. Feoflak'tov and A. Ivanov. J. Gen. Chem. (U. S. S. R.) 13, 457-60 (1941) (English summary); cf. C. A. 34, 12114. A note of 0.92 g. Na in 30 cc. EtOH is treated with cooling and stirring with 6.8 g. Et cyclohexanone-2-carboxylate (b.p. 104°, n _D ²⁰ 1.4705, d ₄₀ ²⁰ 1.0740), to yield a pasté of the Na derivative, which is slowly added to 6 g. NaOAc in 50 cc. water, simultaneously with Ph ₂ NCl (from 5.2 g. PhNH ₂ CD), with stirring and cooling; after 4.5 hrs. the oil is sepd., and the Et ₂ O ext. of the aq. layer is added to the oil; on standing the material crystallizes to a mixt. of the α - and β -forms of di-Et α -ketopimelate phenylhydrazone; the α -form, recrystd. from EtOH, m. 89.5-90°; while the β -form (sepd. mechanically from the mixt.) m. 142-3° (from EtOH). Hydrolysis of the crude hydrazone by alc. KOH yields α -ketopimelic acid phenylhydrazone, m. 143° (from 80% AcOH); a small amt. of a second form was isolated, m. 131-2° (too small amt. prevented further study). Reduction of the hydrazone by Zn in EtOH in the presence of dry HCl yielded 66.6% α -amino-pimelic acid, m. 220° (from water). O. M. Knesl'off | |

IV-VI 1, A-A

Action of nitrous anhydride on dimethylbutadiene.
 A. *Dimethylbutadiene*. *Dimethylbutadiene*, m.p. 101°C., was dissolved in H_2O and treated with NO_2 with ice cooling. The soln assumed a blue color and deposited snow-white crystals of the adduct. It was established that only 1 mole NO_2 can be added to the diene, and a max. yield of 22.0% of the mono- NO_2 adduct, m. 101.5° (from Et_2O), could be isolated. Reduction of this with $\text{Sn}-\text{HCl}$ gave an amine, which was not isolated but gave a *paraldehyde*, m. 230.4°, and a *chloroplatinate*, m. above 260°, while treatment with KOMe and HCl , with heating, gave, in the 1st instance a nitro compd., $\text{C}_6\text{H}_9\text{NO}_3$, m. 80-90°, thus indicating the loss of NO and formation of an unsat. nitro deriv., while in the 2nd instance (heating with HCl in sealed tube) there was formed a liquid product which was distillable with steam and which gave a solid deriv. with $\text{Pb}(\text{NH}_3)_4$, thus the solid NO_2 adduct is a

pseudonitronite of the compd. ($\text{C}_6\text{H}_{10}\text{N}_2\text{O}_3$). After removal of the cryst. adduct, the dark liquid residue was reduced with $\text{Sn}-\text{HCl}$ to give a no. of basic products: (a) colorless, b. 160-80°, (b) yellow, b. 180-200°, (c) dark, b. over 200°, and (d) deep-red residue. Treatment of the high-boiling product (b. 160-80°) with HCl gave $\text{C}_6\text{H}_{10}(\text{NH}_2)\text{Cl}_2$ as colorless crystals; *chloroplatinate*, difficultly sol., yellow; *chlorotitanate*, decomps. 160-3°; *Ba* deriv. m. 211.2° (from Et_2O). Careful fractionation in steam gave $\text{C}_6\text{H}_{10}(\text{NH}_2)_2$, b.p. 97.8-9°, n_D^{20} 1.4745, d_4^{20} 0.9250, and $\text{C}_6\text{H}_{10}(\text{OH})\text{NH}_2$, b.p. 87.8°, n_D^{20} 1.4721, d_4^{20} 0.9324. Steam distn. of the liquid NO_2 adduct gave a small amt. of a volatile liquid and a dark red oily residue which crystall. on standing over HgSO_4 and was identified as a di- NO_2 compd., $\text{C}_6\text{H}_8(\text{NO}_2)_2$, m. 71.5-2° (from Et_2O). Reduction with $\text{Sn}-\text{HCl}$ gave the same diamine as was secured from the pseudonitronite and from the liquid adduct, while ozonization gave *nitroacetone*, m. 46.5°.

TITLE: Increasing the yield of acrylonitrile during the thermal dehydration of ethylene cyanhydrin

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy SSSR.
Khimiya i khimicheskaya tekhnologiya, v.4, no.5, 1961,
837-842

TEXT: Large quantities of acrylonitrile (AN) can be obtained by the thermal liquid phase dehydration of ethylene cyanhydrin (ECH). The process is carried out at a temperature of 170 to 240°C, in the presence or absence of a catalyst. During this process by-products are formed which decrease the yield of AN and therefore increase production costs. Experiments were carried out on increasing the yield of AN by improving the reaction conditions during the liquid phase dehydration process. The authors evaluated the efficiency of some catalysts mentioned in literature (NaCl and sodium formate, HC₂O₄K, (HC₂O₄)₂Ca, (HC₂O₄)₂Cu, (HC₂O₄)₂Zn and (HC₂O₄)₃Al), tested new dehydration catalysts and investigated the effect of temperature and of agitating the reaction medium on the yield of the end-product.

Card 1/4

Increasing the yield ...

S/153/61/004/005/003/005
E142/E485

The starting material ECH contained 93.2% of the basic material, 0.05% HCN, 1.75% amines and 5% of vat residue. This substance was placed in a 250 ml flask and heated in a wood tube. The authors used a so-called "reinforced" resin which they prepared by dehydrating 14 ml of ECH at 209 to 210°C for 90 min; the addition of this resin accelerated the process considerably. The upper layer of AN was neutralized in a separating funnel with 10% H₂SO₄, to separate ammonia and the amine bases, freed from the acidic aqueous layer and subjected the same to azeotropic distillation. Each distillation stage gave 45% of a fraction boiling between 68 and 75°C (which contained water) and 55% of a fraction with a boiling point between 75 to 88°C, the latter being AN. The first fraction was redistilled and this process was repeated four times. The H₂SO₄ solution (after neutralization of the upper layer) and the water were additionally steam distilled; this insured complete separation of AN. The heat transfer and even distribution of temperature in the reaction medium were improved by mechanical agitation (220 rev/min); this increased the yield of AN by 3%. Investigations on the effect of temperature showed that the process is rather slow at a temperature below 180°C;

Card 2/4

S/153/61/004/005/003/005
E142/E485

Increasing the yield ...

a 57% yield of AN was obtained at 170°C. The yield of the resin reached a minimum on increasing the temperature to 110°C and above that temperature the yield of ECH increased again. The most satisfactory yields and lowest resin formation occur at a temperature between 209 and 210°C. Some of the experiments were carried out whilst using a saturated solution of NaCl and bubbling CO₂ through; a 77% yield was obtained; the yield of AN increased to 80% when using NaCl without CO₂. Further experiments indicated that the catalytic dehydration of ECH in a current of nitrogen did not affect the yield of AN. Sodium formiate was most effective amongst the salts of formic acid (when used as catalyst). Experiments in which mixtures of two catalysts were used indicated that these mixtures had no higher catalytic activity than the individual components themselves. These experimental data were used for calculating parameters of an industrial plant with an annual output of 5000 ton AN and it was found that highly satisfactory results were obtained when carrying out the dehydration process with a sodium formiate catalyst at 210°C. TITLE: Synthesis of Poly(phenoxy-methyl-phosphinoxy) Aluminum Oxanes

PERIODICAL: Zhurnal obshchey khimii, 1961, Vol. 31, No. 1, pp. 228 - 231

TEXT: Following their papers of Refs. 1 and 2, and in view of Ref. 3, the authors now studied the syntheses of some organophosphorus-aluminum compounds and tried to convert them to polymers with a principal chain of aluminum oxanes. The synthesis of these organophosphorus-aluminum compounds was made by esterification of the acid chloride of methyl phosphinic acid with phenol, combined with a reaction of the resultant methylphenoxy phosphinic acid chloride with aluminum-n-butylate, according to the equation:

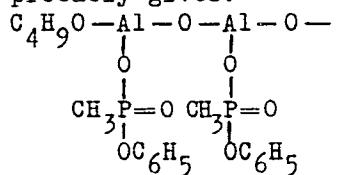

Card 1/3

88485

Synthesis of Poly(phenoxy-methyl-phosphinoxy) S/079/61/031/001/019/025
Aluminum Oxanes B001/B066

Compound (I), hitherto not yet described, was separated in pure condition by distillation of the reaction products (26.2%). The low yield is due to the formation of compound $\text{CH}_3\text{PO}(\text{OC}_6\text{H}_5)_2$ and, presumably, of a mixture of

condensation products of the organophosphorus compounds present. The yield of butyl chloride was 58%. The reaction carried out at 80 - 90°C yields phenoxy-methyl-phosphinoxy-dibutoxy aluminum (II). Elevated temperatures give compounds insoluble in organic solvents. The viscosity of the product of the hydrolysis of compound (II) rapidly increases. This hydrolysis probably gives:

The increase in viscosity depends on the water quantity applied, it is most pronounced at the beginning reaction. The hydrolysis products separated from the solution are solid compounds soluble in butyl alcohol. A study of the thermo-mechanical properties of the hydrolysis products

reveals that an increase on the water quantity in the above hydrolysis does not affect the flow temperature of the polymer considerably, but somewhat decreases the interval between the temperatures of vitrification

TITLE: Stabilization of drift instability in traps with a magnetic field which increases toward the boundary

SOURCE: AN SSSR. Doklady, v. 166, no. 5, 1966, 1084-1087

TOPIC TAGS: plasma instability, magnetic trap, plasma physics, plasma magnetic field

ABSTRACT: The author considers drift instability in a plasma trap. While it would be natural to assume that a magnetic field which increases toward the boundary of the plasma should stabilize drift instability since it is not advantageous from an energy standpoint for the particles to pass into the region of intense magnetic fields, it is shown that this type of stabilization does not in fact take place. The case where the electron temperature is much higher than the ion temperature is considered and the simplest geometry is assumed: a rare plasma in the field of an infinitely long straight filament, where the external boundary of the plasma is a dielectric cylinder. Oscillations are considered for which the phase velocity along the magnetic field is much less than the Alfvén velocity and the speed of ionic sound. The motion of ions along the field is disregarded. It is found that stability of drift waves is as-

Card 1/2

L 23209-66

ACC NR: AP6008079

sociated only with a special form of the distribution function. The plasma is stable with respect to build-up of oscillations in the drift waves for any gradients in the magnetic field. I am grateful to L. I. Rudakov for formulating the problem and directing the work. Orig. art. has: 14 formulas.

Title : Theory and calculation of sea wind-waves

Periodical : Vest. AN SSSR 9, 56-58, Sep 1954

Abstract : Investigations were carried out by the Sea Hydrophysics Institute of the Academy of Sciences USSR for the purpose of finding a method of recording all basic elements of sea wind-waves, which would make it possible to obtain a greater number of sufficiently accurate measurements and the relations determining the dimensions of the waves in relation to wave forming factors - wind velocity, continuation of wind effect, wave acceleration and depth of the sea. The results obtained, are briefly analyzed.

TITLE: Some Deductions Drawn From the Analysis of Certain Observations
on Wind-created Waves (Nekotoryye vyyody iz analiza dannykh
nablyudeniy nad vetrovym volneniem)

PERIODICAL: Tr. Mor. gidrofiz. in-ta AN SSSR, 1956, Vol 8, pp 44-62

ABSTRACT: The problem of the application of Pearson's distribution curves to
the study of ocean waves generated by wind is investigated. The
author proposes to alter the design of the wave recorder so that in
addition to the profile of the wave the rate of wave propagation be
recorded also. Numerous observations of waves were conducted by
the author by means of a photographic wave recorder which recorded
the period, the length, the height, and the velocity of the waves
passing successively past a fixed frame. The coefficients of variance
and skewness were calculated for the distribution curves of the wave
elements. Curves for the period and the height distribution are
given as well as the curves for the velocities and periods of the waves
in a shallow basin and other recorded material. On the basis of the

Card 1/2

ABSTRACT:

The present investigations of oceans and seas show that their most essential processes are dependent on the thermal and dynamic interaction of the ocean and the atmosphere. Therefore the main interest is directed to the investigation of the heat exchange processes between atmosphere and ocean, to the distribution of heat in quantities of water as well as to the formation of streams and waves. Then the authors report in detail on the future research within the frame of the program of the International Geophysical Year. According to a decision of the Committee for the execution of the works of the MGK the investigations in the North Atlantic are to be carried out by the scientific research ships "Mikhail Lomonosov"

Card 1/3

Atlantic 30-58-4-17/44

(Figure 1) , "Ekvator" and "Sevastopol". The "Mikhail Lomonosov" was built in the "Neptun" ship yards in Rostok (DDR), it has a displacement of 6000 t and can also be used for works in ice. Its deck was made longer and a landing place for helicopters was incorporated. The ship has special devices and equipment, among others a deep-sea hoist for anchoring down to 15000 m, 8 hydrologic hoists of the "Okean"-type down to 4000 m, 3 echosonic fathometer automatic recorders down to 12000 m, 1 echosonic fathometer of the "Lodar"-type for vertical and horizontal probing. Then a workshop for experiments and 16 laboratory rooms are installed aboard the ship. The average speed of the ship is 13 knots and it has an operating range of about 11000 miles. The maiden voyage was made for testing the equipment of the ship (Figure 2). But also a number of works of general kind were carried out. Also a group of German scientists under the direction of Doctor E. Bruns took part in this expedition. The second voyage is shown in Figure 3 and is supposed to include the collaboration of all three ships. The main oceanographic work of this voyage will be carried out according to the plan by the MGG, which is further detailed. The "Mikhail Lomonosov" started on this voyage which will last 4 months

TEXT: The author reports on the fifth voyage of the "Mikhail Lomonosov" expeditionary ship, carried out from April 14, to July 7, 1959, to study physical, biological, and oceanographical processes in two parts of the Atlantic Ocean (Fig. 1). Seventy scientists and scientific and technical associates, 4 geophysicists from the SZG and 1 Polish expert took part in the expedition. The results obtained by 63 deep-water stations, 193 bathythermographic observations, surveying with phase meters and echo sounders and by dropping 120 radiosondes permitted studying the basic features of the distribution of physical, hydrological, aerometerological and biological features in the investigated sections. During the entire voyage, the radiation balance and its components were recorded. Fig. 2 shows the change in these components along the meridian of longitude 30°W. in April-May 1959. Based on an analy-

sis of the qualitative composition of plankton, found with the aid of radioactive C₁₄, in a layer stretching from a depth of 500 m up to the surface, three different zones can be distinguished: (1) the mixed water zone of the Irminger current; (2) the zone of the North-Atlantic current; and (3) the zone of tropical and subtropical fauna. The maximum quantity of plankton was found in the subarctic convergence region and near the Azores. Microbiological investigations have shown that the quantity of heterotrophic bacteria increases gradually from north to south, reaching its maximum in the equatorial zone. The greatest morphological diversity in colonies of microorganisms was observed in the waters of the northern and moderate latitudes. New features of a bottom contour, not yet marked in maps, were revealed along the whole sailing route in the North Atlantic Ridge area between the Flores and Fayal Islands and between the stations 368 and 369 (Fig. 1). In some cases, radioactive contamination of the water at depths of 200 - 300 m was discovered. There are 2 figures.

The characteristics of the reflected waves are:

1. The characteristics of the reflected waves are determined by the properties of the reflecting surface, the angle of reflection, the frequency of the waves, the distance between the source and the receiver, and the development of the reflected wave.

In correlation. To this end, the reflection coefficient of some other parameters associated with it are determined by the seismograph. The author considers a method which permits him to stratify and compares the amplitude of reflected waves.

Let us consider the amplitude of the reflected wave at distance R :

$$A = \frac{1}{2} \rho_0 c_0 A_0 \sin \theta_0$$

where ρ_0 is the density of the stratum, c_0 is the product of the velocity of sound in air and geometrical divergence; A_0 is the amplitude of the wave corresponding to the level z_0 , and θ_0 is the angle between the normal to the surface and the direction of propagation of the wave.
