Title : Magnetic Properties of Magnetite at Low Temperatures
Orig Pub : Fiz. metallov i metallovedeniye, 1956, 3, No 1, 186-188

Abstract : A study was made of the effect of the temperature, at which the magnetic field (H) is turned on during the cooling of magnetite, on the temperature of the $\beta \rightarrow \alpha$ transition, and on the value of the magnetization intensity that occurs upon this change. It is observed that turning H on at temperatures above 120° K gives the same result (the magnetization increases by 10%). Different results, but results that are in agreement with each other, are obtained by turning H on at temperature below

A mixture has been composed of ferric and cupric hydroxides; the atomic relation Fe:Cu in one case was 1:0,5, in the second case--1:1. With the raising of the temperature of drying, the hydroxides showed a decreasing catalytic activity, which was tested by way of osication of formic acid with 0.6% hydrogen peroxide at a temp. of 37°C. At a certain, not very high, temperature there appears sensitization and activation of the peroxidative properties--resulting from cupric ferrite formation in which the most active transitory phases are obtained at 350--400°C. Within this temperature range, there appears ferromagnetism and a certain increase of apparent volume. A Roentgenographic examination of samples heated above 400°C demonstrated the spinel structure of cupric ferrite, forming itself through different transitory phases, of a radical structure. At higher temperatures the radical structure disappears and at the same time catalytic activity.

S/140/60/000/004/014/023 xx
C111/C222AUTHOR: Karolinskaya, L.N.TITLE: Direct Decomposition of Abstract Algebras With Marked Subalgebras 16PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Matematika, 1960,
No. 4, pp. 106 - 113

TEXT: The author generalizes a theorem of Hasimoto (Ref. 4) (criterion for the representability of an abstract algebra as a complete direct product of a certain number of its factor algebras) to the case of algebras with marked subalgebras (cf (Ref. 2,3)).

An algebra A is a set of elements with a set of finitary operations f_α . Every f_α is a unique function which associates with every sequence of elements (x_1, \dots, x_n) of A a value $f_\alpha(x_1, \dots, x_n)$ in A . Two algebras are of the same type if they have the same operations f_α . A congruence θ on A is an equivalence relation $x \equiv y(\theta)$ with the property: if $x_i \equiv y_i(\theta)$, $i = 1, \dots, n$, then it holds $f_\alpha(x_1, \dots, x_n) \equiv f_\alpha(y_1, \dots, y_n)(\theta)$. The homomorphism, generated by θ on A , of A onto the algebra $\theta(A)$ of the subsets

Card 1/4 X

Direct Decomposition of Abstract Algebras With S/140/60/000/004/014/023 XX
 Marked Subalgebras

$C(y, 0) = \{x; x \equiv y(0)\}$ of the algebra A is also denoted by 0 . According to Ref. 4) the set Σ of congruences on A is called completely exchangeable if every subset $\{0_{xy}\} \subseteq \Sigma$, $x \in A$, satisfies the conditions for every set of elements $x_y \in A$, $y \in \Omega$ with the property $x_\lambda \equiv$
 $\equiv x \mu(\varphi_\lambda \cup \varphi_\mu)$, where $\varphi_\lambda = \bigwedge_{y \neq \lambda} 0_{y\lambda}$, there exists an $x \in A$ so that $x \equiv x_y (0_y)$ for all $y \in \Omega$.

Given the set $\{A_\omega\}$, $\omega \in \Omega$, of algebras A_ω of the same type, where in every A_ω a subalgebra A'_ω be marked. Let a new algebra A be defined by:

1) $x \in A$ then and only then if the set $\{\omega; x_\omega \in A'_\omega; \omega \in \Omega\}$ is finite, where the sets $x = \{x_\omega; \omega \in \Omega\}$ serve as elements x . x_ω is called the ω -component of the element $x \in A$. The set of elements $x \in A$ for which $x_\omega \in A'_\omega$ for all $\omega \in \Omega$, forms the subalgebra A' of A . The constructed algebra A with the subalgebra A' is called the direct product of the algebras A_ω with marked subalgebras A'_ω and is denoted with $A[A'] =$
 $= \prod_{\omega \in \Omega} A_\omega [A'_\omega]$. A' is the complete direct product of the subalgebras A'_ω .

Card 2/4

85501

Direct Decomposition of Abstract Algebras
With Marked SubalgebrasS/140/60/000/004/014/023 XX
C111/C222

Let $A[A'] = \prod_{\omega \in \Omega} A_\omega [A'_\omega]$ be the direct product of the algebras A_ω with marked algebras A'_ω . The congruence θ_ω , $\omega \in \Omega$, is defined on A as follows: Let $x = \{x_\omega; \omega \in \Omega\} \subseteq A$ and $y = \{y_\omega; \omega \in \Omega\} \subseteq A$; then it holds $x \equiv y (\theta_\omega)$ if and only if $x_\omega = y_\omega$. The congruence θ_ω on A generates a natural homomorphism of the algebra A onto its factor algebra $\theta_\omega(A)$; this homomorphism is also denoted with θ_ω . It holds: $\theta_\omega(A) \cong A_\omega$, $\omega \in \Omega$. Let the homomorphism θ_ω map A onto A_ω ; here A' is mapped onto A'_ω , whereby on A' the congruence θ'_ω is defined, where $\theta'_\omega(A') = A'_\omega$, $\omega \in \Omega$.

Theorem: Let A be an algebra with a marked subalgebra A' and $\{\theta_\omega\}$, $\omega \in \Omega$, be a number of congruences on A inducing on A' the congruences $\{\theta'_\omega\}$, $\omega \in \Omega$, (i.e. on A' the θ'_ω are identical with θ_ω). The algebra A with the marked subalgebra A' decomposes into the direct product of the

"Manufacture of Steel in Vacuum-Arc Furnaces"

Budapest, Kohaszati Lapok, Vol 99, No 6, Jun 1966, pp 252-260.

Abstract: To complement the already installed vacuum-induction furnace, a vacuum-arc furnace has been installed during 1965 at the Research Institute for the Iron Industry to permit the development of the manufacturing technology of high-purity steels on a laboratory scale to aid in subsequent industrial-scale production. The author described the apparatus, which is based on the Heraeus L 200 h, 35-kg. furnace, and discusses its performance, operation, and specifications. A general discussion of the factors on which the principles and practices of vacuum-arc furnace smelting are based was made. Orig. art. has: 12 figures, 14 formulas and 2 tables. [JPRS: 36,867]

282. PRESENT CONDITION IN THE CAMPAIGN AGAINST VENEREAL DISEASES - A nemibetegségek elleni küzdelem helyzetképe (1947-1956) - Károly I. Kőz, az Országos Bőr-Nemikórtani Intez., Országos - NÉPEGÉSZSÉGÜGY 1957, 38/12 (323-331) Tables 10

The necessity of prevention besides the modern method of treatment is emphasized. Lack of prevention may be the cause of the recently renewed increase of morbidity from venereal diseases in some countries. In Hungary in 1947 over 15,000 cases of fresh syphilitic infection were registered, in 1956 only 37. As regards gonorrhoea these figures were over 37,000 and 7,544 respectively. Data are also presented on other manifestations of syphilis (latent, congenital, neurosyphilis, etc.). The results are ascribed for a great part to early detection of cases by means of serial examinations. In gonorrhoea detection of foci proved to be especially important; the still fairly high morbidity from this disease requires more preventive work.

Title : Concerning One Problem in Relativistic Theory of Rigid
Bodies

Orig Pub : Magyar fiz. folyoirat., 1957, 5, No 3, 195-199

Abstract : It is known that in the special theory of relativity, a rigid body has a total of three degrees of freedom. Thus, for example, if a cylinder at rest in Euclidian space is set to rotate, its parts must be deformed. The problem arises whether the tremendous forces that occur upon deformation of an elastic body can deform the Euclidian space, thereby stopping any further deformation of the body itself. This possibility is discussed in the work through the use of simplified example.

AUTHOR: Károlyházy, F.

TITLE: On the coherence properties of "incoherent" scattered radiation

PERIODICAL: Referativnyy zhurnal, Fizika, no. 10, 1962, 2, abstract 10G15
("Acta phys. Acad. scient. hung.", 1961, v. 13, no. 4, 371 - 379,
German; summary in Russian)

TEXT: The coherence of a two-stage scattering process consists in the existence of a correlation between the directions of successively emitted photons and the direction of an absorbed photon, the correlation being dependent on the number of scattering atoms, and vanishing in the case of scattering on one atom. However, this effect is not directly observable, since one of the transitions into the ground state is forbidden, and even if the forbiddance were removed (e.g., with a magnetic field), the correlation, because of the large lifetime of excited atoms, would be significantly weakened by the atomic thermal motion. Therefore, to make observation possible, a process is suggested which consists in a two-stage absorption and the subsequent emission of a photon

On the coherence properties of...

of total energy, both excited states being assumed to be strongly bound to the ground state, while the transition between them is nearly forbidden. Assuming sufficient atomic density and strict directivity of both exciting light beams, it is shown that photons of total energy are scattered "mirror-like" in a direction depending on the wave vectors of the exciting photons and on the normal to the surface bounding the gas volume.

TITLE: The Mach principle in the general theory of relativity

SOURCE: Fizikai szemle, no. 1, 1964, 18-23

TOPIC TAGS: Mach principle, relativity theory, inertia, space-time, general relativity, special relativity

ABSTRACT: A brief historical survey was presented on the Mach principle in general and its significance in the general theory of relativity in particular to clarify the often contradictory definitions and treatments encountered in the scientific literature. Einstein's general theory of relativity is actually a further development of the Mach principle. After considering all aspects involved the Mach principle can be defined as follows: By defining the internal geometry of two infinitesimally adjacent triple-areas within a closed universe and defining the energy and the energy-density for one of the areas, the total space-time and thus the inertial properties of any experimental body of negligible mass are thereby also determined. Further studies are needed for the characterization of the relations between curvature of space-time and energy-impulse density for a finite

✓ Streptomycin and adrenocortical system. L. Mosonyi, I. Szalai, R. Zsoldos and Gy. Karolyhazi (Univ. Budapest). *Endocrinologia* 17, 311-314 (1964) (Hungary). In rabbits daily intramuscular injections of 10 mg. streptomycin at 0.7 mg. sodium resulted in an increase in 7-keto steroid excretion in 4 cases and a decrease in 6 in response to adrenocorticotrophic hormone (I). In all cases there was a decreased response in 11-cysteoid excretion to I. The streptomycin

treatment was accompanied by increased plasma Na and increased blood glucose. D. S. Farmer

"Clinical Investigation of the Cough-Suppressing Effect of Libexin"

Budapest, Orvosi Hetilap, Vol 107, No 30, 24 Jul 1966, pp 1427-1428.

Abstract: Double-blind experiments were conducted on 160 patients to investigate the effects of Libexin, the cough-suppressing drug made by Chinoim Pharmaceutical Works (Chinoim Gyogyszergyar). The effects were similar to those of codeine. The composition of the drug is 3-[α , β -diphenylethyl]-5-[β piperidinoethyl]-1,2,4-oxanediazol-hydrochloride. There were no side effects noticed, and the drug did not suppress expectoration. 9 references, including 3 German, 1 Japanese, 2 Hungarian, and 3 Western.

"Apparatus for Mechanical Cell Disruption."

Budapest, Kiserletes Orvostudomány, Vol XVIII, No 5, Oct 66, pages 477-479.

Abstract: [Authors' Hungarian summary] A mechanical cell-disrupting device was designed which functions with added materials and is suited for the disruption of microorganisms, the production of cell-wall preparations and the separation of enzymes. The advantage of the apparatus is that it can disrupt, at one time, a relatively large volume (5-25 ml) of cell suspension with very good efficiency. According to the experimental results, 15 minutes were sufficient to disrupt the yeast cells used by the authors while the disruption of Str. griseus spores required 40-45 minutes. According to the experiences gained so-far, the apparatus may be suited for the disruption of other microorganisms as well. 1 Hungarian, 7 Western references. [Manuscript received 29 Sep 66.]

Effect of amino acids on experimental arsenphenamine poisoning. Istvan Karolyi. *Orosz Hetilap* 81, 325-6 (1947). Arsenphenamine (0.35-4.0 cc. of a 2% soln.) was injected in the veins of white mice together with 3.5-4.0 mg. glycocoll. Of the exptl. animals 34-36% died; hence glycocoll has no protective effect against sublethal doses.

LAZARIVITS L. and KÁROLYI St. * The importance of liver damage during antisyphilitic treatment, and its avoidance (Hungarian text) BORGYOGY VENER. SZLE 1953, 29 (43)

The authors review the Hungarian data and conclude that arsenobenzene treatment is mostly contra-indicated on account of liver damage. The urobilinogen test is of value only if the urine is diluted 20 times with water. Mild disturbances of the colloid lability tests are no hindrance to arsenobenzene treatment. Six months after subsidence of the icterus, careful arseno-benzene treatment can be resumed with adequate laboratory control. In 94 cases they found - independently of the previous treatment - a positive liver-function test. These cases were treated by penicillin. In 73 unproved cases syphilitic origin of the liver-damage was considered.

2063. KÁROLYI St. and VÉRTES B. *Positive serologic reactions without anamnestic data in syphilis (Hungarian text)
HUNG. DERM. AND VENER. REV. 1954, 30 (4)

Authors observed 1,470 patients, whose serological reactions were positive without anamnestic data. In 472 cases the previous syphilitic infection could be verified by careful anamnestic and clinical examinations. In these cases the Neurath's verification test gave specific positive results only in 47.1%, while the cardiolipin reaction gave them in 88%. In 196 cases syphilis could not be discovered, but there were other, non-syphilitic pathological changes probably causing the positive serological results. Contrary to the published data, collagenous diseases did not produce specific positive results in a significant number. In 802

367

263

CONT

cases (54.5%) neither syphilis nor any other disease could be established. In these cases the decision as to specificity calls for repeated serological and clinical observations over a long period.

835. KÁROLYI ^{Ferenc} and KIRÁLY K. *Tapasztalataink a Treponema immobilizációs vizsgálattal. II. Jelentősége az előzmény nélkül adódó pozitív szerológiai reakciók elbírálásában indikációs területe. Experiences with the immobilization reaction of Treponema (TIT). II. Its significance in the assessment of a positive serological reaction in the absence of a history. Indications ORV. HETIL. 1956, 97/2 (36-39) Tables 3

The results of investigating 470 patients in whom a positive serological reaction was obtained in the absence of a history were analysed. With the aid of a detailed history, as well as careful clinical and familial examination, syphilis could be clinically confirmed in only 57 cases (20.6%). In the presence of complete seropositivity (158 cases) TIT was negative in only 6%; where there was discrepancy in the serum reactions (153 cases) it was negative in a third of the patients; in seropositivity lasting more than 3 months it was negative in 17% of the cases. Where the serum reaction became spontaneously negative (62 cases) TIT was positive in 9.6% of the cases; in the presence of factors which made possible an a-specific combination (53 patients) it was positive in two thirds of the cases. The value of the various methods of verification as well as the range of indications for TIT were discussed.

TYPE : Not given
TITLE : The Production of Fatty Alcohols by High-Pressure Hydrogenation
ORIG. PUB. : Magyar Kem Lapja, 15, No 5-6, 17-180 (1958)
ABSTRACT : The results from an investigation of the reduction of palm nut oil, sunflower oil, and coconut oil to alcohols with H_2 at high pressures and temperatures are presented. The reaction was carried out in a laboratory reactor of 2-liter capacity. It has been found that in the temperature range 300-330° the optimum temperature appears 300°. Varying the pressure in the range 205-262 atm has no effect on the alcohol yield. Satisfactory yields of alcohols were achieved.
