TITLE: Calculating the effective radiation in Central Arctic regions

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 4, 1962, 15, abstract 4B112 (V sb. Aktinometriya i atmosfern. optika, L., Gidrometeoizdat, 1961, 72-79)

TEXT: Under Arctic conditions the usual methods of calculating long-wave radiation flows may result in considerable errors, since the empirical formulas and the radiation graph are constructed on the assumption that the temperature decreases linearly, and that the humidity diminishes exponentially with altitude. In Arctic environments the atmosphere's stratification is anomalous both in summer and winter; more precise specifications have, therefore, to be introduced into the computation scheme that is accurate for middle latitudes. The values of the temperature gradients in layers and of the coefficient A_h in the formula for the humidity --

Card 1/3

Calculating the effective ...

$q_h = q_0 A_h$ (here q_0 , q_h is the specific humidity at ground level and altitude h ; and $A_h = e^{-\gamma h} \cdot p_0 \cdot p_h^{-1}$, where p_0 , p_h is the pressure, and γ is the temperature gradient) -- were determined for summer and winter from the mean data of aerologic sounding at stations CA-4 (SP-4) and CA-5 (SP-5). For 50 cases in the summer and the winter periods calculations of the effective radiation and the counter-radiation were made from N. F. Shekhter's nomogram for set temperature and humidity values at the ground surface; graphs were also constructed to calculate the radiation flows according to ground data for May-September and October-April. It is shown from the data of cloud diagram at latitude 60° and from the mean counter-radiation values at the time of clear skies or continuous cloud that for the Arctic the counter-radiation's dependence on the degree of cloudiness is nearly linear. The values of the coefficients k in the known formula $\Pi_n = \Pi_0 (1 + kn)$ were calculated for the Arctic from the average cloud heights, the temperature relationship of the radiating capacity of clouds (according to M.S. Marshunova), and the data of aerologic soundings. The comparison

TITLE: Relation of the radiation balance to the boundary layer stratification

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 7, 1962, 22, abstract 7B128 (V sb. Aktinometriya i atmosfern. optika, L., Gidrometeoizdat, 1961, 32-36)

TEXT: The relation between the radiant energy balance in the atmosphere's lower layer and the vertical temperature profile is investigated. The results of measurements of the radiation balance and the temperature gradient on clear, cloudy, and overcast days are used for this purpose. It was established that the ratio for the long-wave radiation balance (B_1) to the radiation of the underlying surface (σT_n^4), which is considered as a black body when the surface temperature is T_n , is related to the temperature gradient in the layer 0 - 100 m. In equilibrium conditions $B_1/\sigma T_n^4 \approx 0.2$.

Card 1/2

Relation of the ...

S/169/62/000/007/096/149
D228/D307

In case of inversions $\Delta B_1 / \Delta \gamma = 0.01$; in the event of superadiabatic gradients this ratio equals $0.05 \text{ cal/cm}^2 \cdot \text{min.deg}$. For conditions of continuous cloud B_1 does not depend on γ . Analogous relations were obtained, too, for the ratio of long-wave atmospheric radiation (E_a) to σT^4 (T being the air temperature). *[Abstracter's note:*

TITLE: The forming of the radiation balance of the underlying surface

SOURCE: Vses. nauchn. meteorologich. soveshch. Trudy*, v. 7. Fizika prizemnogo sloya. Leningrad, 1963, 240-248

TOPIC TAGS: meteorology, radiation balance, ground radiation, boundary layer, heat balance, actinometry, actinometric observation, Arctic radiation, atmospheric boundary layer, surface albedo, radiation scattering, radiation

ABSTRACT: There are two groups of factors which determine the value of the radiation balance. Investigation of the influence of factors of the first group, based upon astronomical and geodetic variables, leads to the establishment of the correlation $B = aQ + b$ where Q = total radiation, B = radiation balance, and a and b are coefficients. Factors of the second group, based on the properties of the underlying surface, lead to the conclusion that coefficients a & b are significantly different for different types of underlying surfaces, seasons, and even for certain times of the day. Tabulated data are included for Lake Sevan and the Tsimlyanskoye reservoir. It is concluded that the supposition of the equality of atmospheric radiation in adjacent regions with different

TITLE: On the profile of upwelling fluxes of longwave radiation above a reservoir

SOURCE: Leningrad. Glavnaya geofizicheskaya observatoriya. Trudy, no. 1, 1965. Fizika pogranichnogo sloya atmosfery (Physics of the boundary layer of the atmosphere), 144-148

TOPIC TACS: upwelling longwave radiation, helicopter flight, radiometer, germanium filter, meteorological condition, downwelling radiation, radiation balance

ABSTRACT: In spring, 1963, measurements of upwelling longwave radiation were made above Tsimlyansk Reservoir by a helicopter in horizontal flights at heights of 10, 20, 30, 50, 100, and 200 m using a radiometer with a germanium filter. On the basis of these measurements, data profiles of upwelling longwave radiation were drawn characterizing the energy distribution with height. Profiles obtained from direct measurements were compared with those computed theoreti-

Card 1/2

L 14569-66

ACC NR: AT6004156

cally. Both results agree inasmuch as meteorological conditions during the observation period did not change. The downwelling radiation was measured above both the water surface and dry land. The downwelling radiation measured at various heights was reduced by the formula

$$\frac{E_{\downarrow H=0}}{E_{\downarrow H=s}}$$

for comparison to the intensity above the ground. A table in the original article contains the reduced downwelling radiation for both the water and dry land. The difference between the downwelling and upwelling radiation is the radiation balance, the gradient of which was computed by height and given in a table. This gradient does not change above the height of 200 m either above the ground or the water. Orig. art. has: 3 figures, 3 tables, and 2 formulas. [EG]

12, 55

SOURCE: Leningrad. Glavnaya geofizicheskaya observatoriya. Trudy, no. 1, 1965.
Fizika pogranichnogo sloya atmosfery (Physics of the boundary layer of the atmosphere), 134-139

TOPIC TAGS: meteorology, water supply system, water, radiation balance

ABSTRACT: Data are given from calculation of changes in the radiation balance for various sizes and depths of reservoirs. The calculations are based on surface temperatures and air temperature and humidity above the reservoir. The results indicate that an increase in the size of the reservoir (at a depth of 20 m) results in a reduction in the radiation balance in the first half of the summer and an increase in the second half. The radiation balance is more dependent on depth than size.

Card 1/2

L 14176-66

ACC NR: AT6004155

The variation in radiation balance with depth is greater in the early spring months and late autumn months. The dependence of radiation balance on depth is greater in small reservoirs than in large ones. Curves are given showing the seasonal variation in radiation balance as a function of depth for reservoirs of various sizes. A change in meteorologic conditions above the reservoir has a considerable effect on the radiation balance. Orig. art. has: 3 figures, 3 tables, 2 formulas.

TITLE: Evaluation of random errors of the Laykhtman-Kucherov differential pyrgeometer

SOURCE: AN SSSR. Mezhdunudomstvennyy geofizicheskiy komitet.
Meteorologicheskiye issledovaniya, no. 15, 1966, 80-82

TOPIC TAGS: differential pyrgeometer, radiation flux, sun shadow method,
random error, PYROMETER, METEOROLOGIC INSTRUMENT, EARTH RADIATION

ABSTRACT: The Laykhtman - Kucherov differential pyrgeometer is an instrument with an operating principle different from most other instruments for measuring radiation fluxes. Therefore, a more careful statistical analysis is necessary to estimate the values of random instrumental errors. Calculations, show that a method offered by the instrument designers for the processing data is undoubtedly preferred. The accuracy of measuring radiation fluxes at night and the low reliability daytime made measurements with the unshaded receiver are evaluated. It is concluded that the conversion factor obtained by the sun-shadow

Card 1/2

L 08301-67

ACC NR: AT6031975

O

method is not sufficiently accurate and that it is necessary to calibrate the instrument by other methods. When comparing the values of random errors of the differential pyrgeometer with the errors of some other instruments, it is necessary to take into account the technical specifications of the instrument according to the number of measurements for a certain period of time and to compare random errors of different instruments for an equal number of readings. actions under the sustained influence of high temperatures

SOURCE: Ref. zh. Biologiya, Abs. 88262

REF SOURCE: Sb. Kletka i temperatura sredy. M.-L., Nauka, 1964, 194-196

TOPIC TAGS: cell physiology; high temperature effect, biology

TRANSLATION: Barley sprouts or fragments of coleoytile were removed from their optimal temperatures (17-18°) to a medium with a 44° temperature. The physiological processes were studied from the starting moment of thermal effect to the moment of complete destruction of the cells. By using a comparatively simple viscous mass for changing the permeability of the protoplasm (P), it was established that both at the beginning and at the end of the thermal effect, P had a weak power for the retention of water-soluble matter, such as monosaccharides, amino acids and cells. A description is given of the "history of thermal disease." The double-phase and wave-like changes with time in P under the thermal effect were clarified. Under the effect of

TITLE: Synthesis of α -oxide- α -furylphosphinic acid esters

SOURCE: Plasticheakiye massy, no. 4, 1965, 59-60

TOPIC TAGS: ester, ether, furylphosphinic acid, polymer, monomer

ABSTRACT: In an effort to expand the results obtained by V. S. Abramov and A. S. Kapustina (ZhOKh, 27, 173, 1957), the authors synthesized and studied α -oxide- α -furylphosphinic acid esters with aliphatic, heterocyclic, and aromatic radicals. The reactions of furfurole with dihexyl-, diheptyl-, dioctyl-, dinonyl-, didecyl-, ditetrahydrofuryl-, and diphenylphosphites were investigated. All the esters (except the crystalline dimethyl ester) were yellow, viscous, nondistillable liquids. Percentage content of hydroxyl groups and iodine numbers were determined in all esters, the first one by the method described by I. P. Losev and O. Ya. Fedotova (Praktikum po khimi vysokopolimernykh soedineniy, Goskhimizdat, 1962, 93), the second by the method of pyridinesulphatebromide. The experimental procedures used in producing dimethyl- α -oxide- α -furylphosphinate in an atmosphere of sulfur ether, dihexyl- α -oxide- α -furylphosphinate, and ditetrahydro- α -oxide- α -furylphosphinate.

TITLE: Absorption spectrum in the near infrared region of <u>neutron-irradiated silicon</u>		
SOURCE: Optika i spektroskopiya, v. 20, no. 2, 1966, 337-339		
TOPIC TAGS: silicon, IR absorption, absorption spectrum, neutron irradiation		
ABSTRACT: The authors studied the infrared absorption spectra of neutron-irradiated single crystals of silicon in the 0.7—1.7 μ range. The specimens were irradiated with doses of 10^{17} — 10^{19} fast neutrons/cm ² . The specimens were plane-parallel polished plates with thicknesses of 30—60 μ and varied with respect to conductivity type, dopant concentration, and radiation dose. The spectra were taken at room temperature. An analysis of the spectrograms shows that the threshold for a sharp increase in absorption in the 0.7—1 μ range is the same for both irradiated and nonirradiated samples. The irradiated specimens show absorption maxima at 1.05, 1.23, 1.4, and 1.5 μ . The intensity of these bands is proportional to the radiation dose and decreases as

TITLE: Aging of polystyrene plastics. Thermal aging of styrene -
acrylonitrile copolymers

PERIODICAL: Plasticheskiye massy, no. 6, 1962, 3-10

TEXT: Thermal aging of styrene - acrylonitrile copolymers CH-10 (SN-10)
(10.3% acrylonitrile groups), CH-20 (SN-20) (20.15 and 21.4% acrylonitrile
groups, molecular weight 113,000 and 119,000), and also CH-28 (SN-28)
(59.55, 26.5, and 27.7% acrylonitrile groups, molecular weight 166,000,
120,000, and 132,000) was investigated on films 50-100 μ thick between
140 and 180°C, and compared with that of polystyrene films. For the
copolymers, dichloro ethane was used as solvent and petroleum ether as
precipitant, with benzene and ethyl alcohol for the polystyrene. The
molecular weights were calculated from the viscosimetric data of L. N.
Veselovskaya. The degree of aging was estimated on the basis of the
measured intrinsic viscosity, the nitrogen content, and the carbonyl group

Card 1/3

Aging of polystyrene plastics. ...

formation determined by absorption spectrometry. The rate of formation of oxygen-containing groups falls as the acrylonitrile content in the copolymer rises, and also with its molecular weight (Fig. 8). It is 2-3 times greater in polystyrene than in the SN-28 copolymer. Azomethines with one OH group were effective stabilizers in ortho- and para-position in aniline and one NH₂ group in para-position only. Azomethine obtained by introducing the group (CH₃)₂N in benzaldehyde proved to be inefficient while the same compound with one CH group in aniline was highly effective. Azomethines based on salicyl aldehyde and hydroxy aniline are also good stabilizers. All azomethines discolor the product and are only recommended for black products. Effective alkyl phenols are phenyl cresylol propane, phenyl-isopropyl resorcin, phenyl-isopropyl pyrocatechin, 3-methyl-4-phenyl ethyl-6-isopropyl phenol, 3-methyl-4-phenyl isopropyl-6-isopropyl phenol, butyl gallate, bis-[2-tert-butyl-4-methyl phenol]-methane. Extension of the carbon chain between two benzene rings does not greatly affect the stabilizing effect while the latter is increased by introducing a CH₃ group in the benzene ring in the case of dimethyl phenyl-p-cresol and dicresylol propane. There are 11 figures

TITLE: Friction materials paired with low-carbon steel

PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk, 48. Mashinostroitel'nyye materialy, konstruktsii i raschet detaley mashin, no. 1, 1963, 5, abstract 1.48.28 ("Vestn. tekhn. i ekon. inform. N.-i. in-t tekhn.-ekon. issled. Gos. kom-ta Sov. Min. SSSR po khimii", no. 3, 1962, 30 - 32)

TEXT: Friction properties of woven, cast, pressed and rolled materials paired with C415-32 (Sch 15-32) cast iron and Cr.35 (st.35) steel were investigated. 22 x 27 x 6 mm samples were tested on a unified constant friction machine at 100 - 120°C, 7.5 m/sec sliding speed and 2.7 kg/cm² specific pressure. The results of the tests are summarized in a table. It is established that woven and rolled bands cannot work at elevated temperatures since at 200 - 240°C the coefficient of friction decreases. Cast material FK-24a (FK-24a) at 100 - 120°C has a lower coefficient of friction than woven and rolled bands,

TITLE: Calculation of acceleration of a system with a hydrodynamic clutch

PERIODICAL: Vestnik mashinostroyeniya, no. 4, 1963, 9-14

TEXT: Hydrodynamic clutches (couplings) are widely used in drive mechanisms of pumps, centrifuges, and other mechanical equipment and in transmissions of automobiles and other vehicles. The basic merit of hydraulic clutches is the capability of acceleration of a system with large moments of energy without overloading the motor. For design of drive mechanisms, besides the determination of the parameters of a steady operation, it is especially important to also estimate the indicators of transition processes. Pertaining to this, the time of acceleration of a system and the nature of the change according to time of the angular velocities and moments of the motor and of the driven machine are considered. Calculation of transition processes also allows one to determine the

Card 1/3

L 13124-63

S/122/63/000/004/001/006

Calculation of acceleration ...

quantity of heat liberated in a hydraulic clutch in the time of acceleration, which is necessary to fulfill its heat balance. A diagram of a drive mechanism with a hydrodynamic clutch is presented, where ω_1 and M_1 -- the angular velocity and moment of the motor, J_1 -- moment of energy of the driving part of the assembly referred to the entry of the shaft, ω_2 and M_2 -- angular velocity and moment of the dependent mechanism, J_2 -- the moment of energy of the dependent parts of the assembly referred to the exit of the shaft. The process of acceleration of such a system was divided for a general case into three periods (I, II, III), which are individually examined. The characteristics of the elements of the assembly with a hydrodynamic clutch are graphically shown for the motor and for typical forms of the dependent mechanisms. The types of dimensionless characteristics of a hydrodynamic clutch during acceleration of the dependent mechanisms are given. The method of calculation of the working parameters of a system during acceleration is graphically presented, as well as the change of the working parameters of a system according to time during acceleration and in relation to the acceleration of the motor. A method of simplified calculation

Card 2/3

L 13124-63

Calculation of acceleration...

S/122/63/000/004/001/006

of the change of the parameters of a system according to time during acceleration is given. With aid of this graphical data, a four step order of calculations is recommended for the correlations of the angular velocities and moments of a system with a hydrodynamic clutch. For a given case of an assembly of a hydrodynamic clutch, the time of acceleration is somewhat reduced and the start-up is significantly alleviated because without a hydraulic clutch the motor works in an unstable side of its characteristics beyond 50 sec., but with a hydraulic clutch -- no more than 5 sec. The presented method with small modifications is applicable for the calculation of the acceleration of a system with a torque converter. There are 9 figures and 2 non-English language references.

Title : Adhesion of high-polymers to glass and its dependence upon pressure and
nature of the surrounding gas medium

Periodical : Dokl. AN SSSR, 97, Ed. 3, 475 - 478, July 21, 1954

Abstract : A method of determining the discharge potential, discharge gaps and sur-
face density of electrification, by studying the polymer-glass adhesiograms,
is described. The effect of pressure and nature of the surrounding gas
on the adhesion of high-polymers to glass was determined by the Paschen
law. By studying the effect of various factors, including the molecular
structure of the adhesive and liner, it is possible to make a rational
selection of gluing and lacquer forming polymers and form conditions
increasing the adhesion. Eight USSR references. Graphs.

TITLE: Swelling cement based on high-alumina clays

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 21, 1961, 311, abstract
21K308 (Tsementy, no. 1, 1961, 9 - 13)

TEXT: A swelling cement (SC) has been obtained in Bulgaria on the base of Portland cement clinker, and expanding additive consisting of three basic components: calcined high-alumina clay, air-slaked lime, and gypsum. The clinker-to-additive ratio was 70:30. The volume of SC is increased by storing in water, moist air, and air. The degree of expansion depends on the composition of the solution and on the storing conditions. The strength of SC tested in solution of great consistency while being lower than that of initial cement in the first days of hardening, becomes equal to it after six months. The strength of SC in plastic solutions is considerably lower than that of initial cement (50-60% after 28 days, 85% after 15 months). SC samples subjected to 150 freezing-and-thawing cycles had a greater compressive strength than before freezing. SC proved to be

Card 1/2

Swelling cement based on high alumina clays

S/081/61/000/021/050/094
B110/B101

stable against magnesia and sulfate corrosion (except for 1% Na_2SO_4 solution). SC is normally impervious to water and more strongly bound to the reinforcement. The strength of SC concrete with a cement consumption of 400 kg/m³ attained 50% of the initial cement strength during the early time of hardening, and rose to 93% after three months. TITLE: On the Design of Jet Devices for Pumping Water out of Artesian Wells (K voprosu o raschete struynikh apparatov dlya pod'yemnye vody iz artezianskikh skvazhin)

PERIODICAL: V sb.: Gidromashinostroyeniye. (MVTU, Vol 71), Moscow, 1957,
pp 3-14

ABSTRACT: Water-lifting devices for artesian wells of medium depth (about 60-70 meters) consisting of a centrifugal pump on the surface and a water-jet apparatus located in the well and fed by the surface pump are discussed. Two schematic arrangements of such water-lifting devices are given, which differ in the location of the water-jet apparatus (upstream and downstream of the pump). The procedure of matching the pumps and the water-jet apparatus is described with a view of obtaining the greatest possible efficiency for the water-lifting installation; graphical methods for the design analysis of a complete installation including the piping are provided for varying conditions of the hydraulic operation.

TITLE:

Phosphorylated Chlorovinyl Ketones. Production of Phosphorylated Chlorovinyl Ketones From Vinyl Acetate and Isopropenyl Acetate

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 1, pp 89-91 (USSR)

ABSTRACT:

The present paper gives the results obtained by investigation of the reaction of phosphorus pentachloride with enol acetates - vinyl acetates and isopropenyl acetates. By means of this reaction which readily takes place, the first representatives of a new group of phosphor-organic compounds - the phosphorylated β -chlorovinylketones - were obtained. The following were prepared: α -acetyl- β , β -dichloro ethyl phosphinic acid chloride, diethyl ester of the α -acetyl- β , β -dichloro ethyl phosphinic acid in the presence of a base and pyridine, diethyl ester of the α -acetyl- β -chlorovinyl phosphinic acid, α -acetyl- β -chloro propenyl phosphinic acid chloride, and diethyl ester of the α -acetyl- β -chloropropenyl phosphinic acid. The newly obtained kinds of phosphoric-organic compounds will be used for various syntheses characteristic of β -chlorovinyl ketones. In the first place, however, they will be employed for the production of phosphorylated heterocyclic compounds of the pyrazole-,
