TITLE: On some peculiarities of changes in microhardness and crystal structure of brasses

PERIODICAL: Referativnyy zhurnal, Metalurgiya, no. 3, 1962, 56, abstract 31357
("Tr. In-ta yadern. fiz. AN KazSSR", no. 4, 1961, 63-68)

TEXT: The changes in microhardness of brasses as a function of composition at hardening at different temperatures were investigated, and also an X-ray study of the crystal structure of alloys at higher temperatures was carried out. The microhardness of brasses containing 5 - 40% Zn was measured. The microhardness of alloys in a cast state and after hot deformation ($\sim 700^{\circ}\text{C}$) and annealing (4 hours at 600 and 800°C) was determined. On the microhardness curve of cast samples maxima are observed which indicate the presence of certain changes in the phase composition of alloys. A considerable decrease in the microhardness of alloys with $> 25\%$ Zn after annealing is considered to be connected with the fixation of the smelt, that is with the hardening of the liquid. After deformation and annealing an ordering takes place in alloys, with the formation of a

TITLE: On the anomalies in the electrical resistance of brasses and aluminum bronzes

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 3, 1962, 14, abstract 3192
("Tr. In-ta yadern. fiz. AN KazSSR", 1961, 4, 69-73)

TEXT: A determination was carried out of the dependence of ρ upon the temperature and duration of tempering of hardened specimens of alloys with 5 - 38% Zn and 1 - 6% Al (the remainder - Cu). The specimens were hardened from 800°C in ice water and subjected to tempering at 100 - 600°C for durations of 10 min to 12 hours. It was established that the anomalies of the mechanical and physical characteristics of the α -solutions of Zn in Cu were caused by the ordering process. The maximum ordering occurs at a Zn content of ~10 and 30%. The ordering process is preceded by the appearance of the K-state in the case of a long tempering of hardened alloys at 200 - 300°C. The appearance of the K-state and the ordering process are also observed in Al-bronzes. The homogeneous aging of unsaturated solid solutions, observed in brasses and Al-bronzes represents

TITLE: The anomalies of electrical resistance of Cu-Ni alloys

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 3, 1962, 56, abstract 3I356 ("Tr. In-ta yadern. fiz. AN KazSSR", no. 4, 1961, 74-77)

TEXT: The change of the specific electrical resistance after tempering at 100 - 600°C of 15 min. to 12 hours' duration was studied on alloys containing 5 - 50% Ni and water quenched at 850°C. For alloys with 5 - 30% Ni the electrical resistance changes slightly up to 300°C, afterwards it increases rapidly at the tempering up to 600°C; over 600°C the increase of electrical resistance becomes slower and sometimes disappears. This fact is connected with the emergence at temperatures of over 300°C of the short-range order (K-state) which disappears at temperatures over 600°C. Alloys with 40 and 50% Ni at tempering at 400°C display the minimum electrical resistance which points to the emergence of the ordering which disappears at temperatures up to 600°C. For the alloy with 40% Ni this effect is expressed more strongly. The decrease of electrical resistance

("Tr. In-ta yadern. fiz. AN KazSSR", 1961, v. 4, 74 - 77)

TEXT: The change of the electric resistance ρ was investigated in solid solutions of Cu-Ni after hardening and tempering in order to verify the previously stated assumption that the ordering in alloys is preceded by the formation of the K-state. From the curves of the dependence of the relative change of ρ upon the tempering temperature, it is concluded that in alloys containing Ni up to 30% the K-state arises during tempering. In alloys with 30 - 50% Ni the K-state is followed by the ordering process.

TITLE: Anomalous variation of x ray interference structures in brass

SOURCE: Fizika metallov i metallovedeniye, v. 17, no. 2, 1964, 293-296

TOPIC TAGS: brass, x ray analysis, x ray diffraction pattern, lattice parameter variation, annealing, hardening, interference pattern variation

ABSTRACT: A new "oblique" method for x-ray analysis of alloys was developed and used to study detailed processes occurring in the thermal and mechanical treatment of alloys. It involves the rotation of a coarse-grained metal sample around its axis at an angle of $90^\circ - \theta$ relative to the incident x-ray beam. A basic requirement of this method is that the incident radiation should produce a reflection at an angle not less than $76-80^\circ$. These reflections make it possible to measure the lattice parameter with sufficient accuracy and to analyse the state of the alloy according to the interference spots. This method was applied to the study of Cu-Zn alloys with 15-40 % by weight Zn. To study the temperature behavior of the alloy structure, the samples were first annealed for 750 hours, followed by a gradual

Card 1/2

ACCESSION NR: APL017366

cooling from 7500 to room temperature. Other samples were quenched from 700, 750 and 8000, with subsequent tempering from 100 to 7000. During tempering of hardened brass samples the anomalous variations were observed in the x-ray interference structures and in the crystalline lattice parameter. These were believed to be related to a process of metal ordering. Maximum anomalous variation was associated with the 7500 quench. The change in the time lag at that temperature resulted in the appearance of new lattice parameter anomalies during tempering. The hardening at 8000 caused the disappearance of the anomalies observed in the structure of the x-ray reflections. Orig. art. has: 5 figures.

TITLE: A device for measuring the scattering coefficient of radiation. Class 42,
No. 187356

SOURCE: Izobrateniya, promyshlennyye obraztsy, tovarnyye znaki, no. 20, 1966, 137

TOPIC TAGS: light scattering, radiation, measuring instrument, optic system

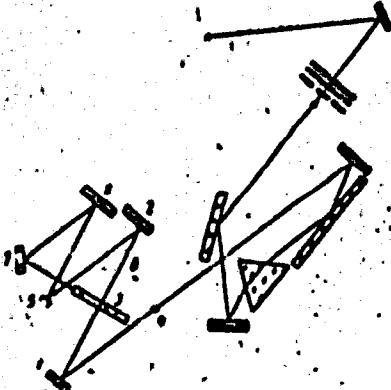

ABSTRACT: This Author's Certificate introduces: 1. A device for measuring the scattering coefficient of radiation. The installation contains a radiation source and receiver, monochromator and optical system for projecting the stream of radiation on the input slit. The range of angles at which the scattering coefficient can be measured in radiation of fixed wavelengths is expanded by using an optical system consisting of a parabolic and a spherical mirror or two spherical mirrors with the specimen between them in the form of a plane-parallel plate. The output slit of the monochromator is located at the main focus of the first mirror, while the radiation receiver is placed at the focus of the second. This receiver is mounted so that it may be moved in the focal plane. 2. A modification of this device for measuring radiation scattering coefficients at an angle of 90° to the surface of the specimen.

PUBLICATION: Trudy Glavnogo geofizicheskogo observatorii, 1977, Nr 69, pp. 77-79 (ussr)

ABSTRACT: Although polynyas form only 5 percent of the total Arctic ice cover, they play an important role in its heat balance. The authors analyse the problem by comparing the components of heat balance for ice-covered and open water surfaces. The analysis is mathematical and the conclusion is that 50 percent of the heat emitted in the Arctic comes from the open polynya areas. There are 1 Soviet reference, 2 tables, and 1 figure.

Section 12. Limitations of Proprietary Characteristics
Section 12. General provision of section relating to the term
of protection.

Proposition 2.2. Assuming the classical distribution of temperatures in both
models, \hat{F}_1 and \hat{F}_2 , the distributions of the empirical distributions of temperatures and
precipitation in the sample coincide.

Proposition 2.5. *Given* \mathcal{A} , *some* \mathcal{B} *such that* $\mathcal{B} \subseteq \mathcal{A}$. *Then* \mathcal{B} *is an* \mathcal{A} -*universal* *model* *if and only if* \mathcal{B} *is a* \mathcal{A} -*universal* *structure*.

the same of the formation of the new Capital Government is probably made up partly of the people of the country, or the Empire, themselves, because the majority of the people are natives and the result of their domestic, industrial and agricultural labour. Industrial, agricultural, mining, the mercantile, shipping, banking, and other classes of the population of the Empire, constitute, as well, some of the factors determining the formation of the new Capital Government. In addition, some portions of the people in the Empire are engaged in the production of the necessities of life, and others are engaged in the production of the luxuries of life, which are used by the upper classes.

TITLE: Calculation of the vertical wind profile¹²⁴⁴⁵⁵ in the boundary layer of the atmosphereSOURCE: Leningrad. Glavnaya geofizicheskaya observatoriya. Trudy, no. 167, 1965.
Fizika pogranichnogo sloya atmosfery (Physics of the boundary layer of the atmosphere), 3-28

TOPIC TAGS: atmospheric boundary layer, wind profile, atmospheric turbulence, mathematical analysis

ABSTRACT: This paper is a further development of the theoretical model for the structure of the boundary layer of the atmosphere in stationary conditions as a function of external parameters. A mathematical model is proposed for the coefficient of turbulence and a system of equations is given for determining the vertical

profiles of meteorological elements of the boundary layer under stationary conditions based on external parameters. This system of equations accounts for motion, heat transfer in the soil and in the atmosphere and humidity transfer in the atmosphere. The initial and boundary conditions for the problem are stated and a general solution is given. Formulas are derived for calculating the vertical wind profile in the boundary layer of the atmosphere and a computational scheme is proposed for determining the various parameters appearing in these formulas. Examples are given illustrating the effect of the coefficient of turbulence on the structure of the boundary layer of the atmosphere. It is found that the coefficient of turbulence increases with altitude according to a power law, reaching a maximum at some point and then decreasing with altitude. An appendix to the article gives tables of the functions appearing in the formulas derived. Orig. art. has: 2 figures, 6 tables, 70 formulas.

TITLE: Cathode crystallization during titanium purification in melted salts

SOURCE: Zhurnal prikladnoy khimii, v. 39, no. 3, 1966, 577-584

TOPIC TAGS: titanium, metal purification, electrocrystallization, chloride, electrolyte, electrolysis, titanium electrocrystallization

ABSTRACT: In studying the electrocrystallization of titanium from melts and development of electrolytic methods of preparing and refining titanium, it has been determined that titanium crystallizes at the cathode at temperatures of 700 to 900°C in five basic crystal forms, namely, needle-shaped, prismatic, laminar, octahedral, and finely disperse. A marked growth and further development of forms in crystal grains was observed at temperatures of 700 to 850°C. Cathode metals of various coarseness (except for the 0.25 mm size) are basically of identical shape but differ in sizes of crystals. The effects of the concentrations of titanium chlorides in the electrolyte, duration of electrolysis, process temperatures, and impurities of certain salts in the electrolyte on titanium electrocrystallization are shown.

Title : Stages of Transformation of Nitrogen of Various Amino-Acids and Ammonia into Urea in the Liver of Mammals.

Orig Pub: Biokhimia, 1956, 21, No 5, 516-527.

Abstract: The reduction mechanism of N of various aminoacids and NH₃ into urea in the liver of rats was studied. It was demonstrated that the utilization of N of aminoacids and other compounds during the second phase of the ornithine cycle takes place only after a preliminary transfer of N to asparagine acid (I). N of noncarbon aminoacids is transferred to I primarily

by a 2 step reaction of peramination with the participation of ketoglutaric acid as an intermediary carrier of NH₂. This is demonstrated by the application of fluoracetic acid, a substance inhibiting the action of aconitase, thereby preventing the synthesis of ketoglutaric acid. NH₃, liberated by the oxidizing deamination of serine and histidine, is transferred to I by transamination through glutaminic acid. In liver homogenates of rats with B₆ avitaminosis, the synthesis of urea from citrulline and other aminoacids remains undisturbed, which is explained by the high residual activity of aminopherase.

✓ Hardening of lime-clay-sand building materials in hydro-
thermal conditions. P. P. Ilnitskaya and O. V. Klyushka
Dotlady. Akad. Nauk SSSR, 90, 1979, 111-114.
Brackets, containing a fixed amount (0.5%) of CaO and varying
ratios of kaolinite and sand, were exposed for 24 hrs. to
steam at 8 atm. The tensile strength increased with
increasing kaolinite content. Exposed to high-pressure
steam, kaolinite is activated and reacts with lime, forming
 $4\text{CaO}\cdot\text{Al}_2\text{O}_5\cdot 12\text{H}_2\text{O}$ or $5\text{CaO}\cdot\text{Al}_2\text{O}_5\cdot 3\text{CaO}\cdot 31\text{H}_2\text{O}$. When
lime was also admixed, both clay hydraulic properties

Abstract : The following subjects and items are briefly discussed and described: A two-voltage rectifier used for rectification of the 30C-320 and 130-150 volt plate circuits in a cathode-ray tube; electronic compensators for stabilizing power feeds; the use of the 6ZhZP pentode as an amplifier; the semi-duplex operation during amateur radio communications; and the contest of amateur radio clubs in establishing radio communication with Experimental Arctic Stations No. 3, and No. 4. Circuit diagrams; graphs; tables.

TITLE: Stray Magnetic Fields in TV Sets
(Magnitnyye nevodki v televisorakh)

PERIODICAL: Radio, 1956, Nr 8, p. 43 (USSR)

ABSTRACT: An analysis of a-c power spurious voltages affecting the image on the screen and measures to prevent them. Magnetic interference results in distortion of the edges of the raster, sneak a-c currents in the supply circuits result in a horizontal dark stripe.

The power transformer is usually responsible for the magnetic stray fields in a tv set. To minimize this interference it is recommended: to mount the transformer as far from the picture tube as possible, to position it at the optimum angle, to equip the transformer with a short-circuited (heavy copper) turn, and to mount the transformer under the chassis.

The supply filter is usually responsible for sneak power-frequency currents. To eliminate them it is recommended to provide a 50-c or 100-c rejection filter.

TITLE: A Generator for Testing the Linearity of TV Scanning
(Generator dlya proverki lineynosti razvertok televizora)

PERIODICAL: Radio, 1956, Nr 12, pp. 37-38 (USSR)

ABSTRACT: A description of a self-made generator and the method of linearity testing.

Three tubes are used: two type 6H9C double triodes for cathode-coupled multivibrators and one type 6XK8 pentode for high-frequency oscillator. The multivibrator square-pulse frequency can be varied from 30 to 250 kc. Applied to the modulator electrode of the picture tube this frequency produces from 4 to 16 vertical black-on-white stripes. Hence the linearity of the horizontal sweep can be easily tested.

The second multivibrator produces a square-pulse frequency between 50 and 500 cycles/sec. Applied to the modulator electrode this frequency causes from 2 to 10 horizontal stripes to appear on the screen. These help to check the linearity of the vertical sweep.

Pulse repetition frequencies 30-250 kc and 50-500 c can be used for testing of the signal transmission through the video amplifier. The h-f oscillator generates frequencies between 45 and 108 mc.

A Generator for Testing the Linearity of TV Scanning

The technique of testing of scanning in a tv set is explained in some detail. A simultaneous application of both pulse repetition frequencies results in a chessboard-resembling pattern on the screen. Any irregularity of the pattern is an indication of nonlinearity. The nonlinearity coefficient can be easily determined by a ruler and the use of a simple formula.
