"Uratic Lithiasis"

Prague, Casopis Lekaru Ceskych, Vol 105, No 32, 15 Aug 66, pp 856-860

Abstract /Authors' English summary modified/: Lithiasis may be caused by increase in the secretion of urinary acid through the urine; when this secretion is normal, the disease is due to the decreased ability of the renal tubule to produce ammonia, which affects the low pH of the urine. In both cases urate lithiasis is promoted by the low solubility of the urinary acid in an acid medium. The most important hormone for patients with uricosynthesis with lithiasis of the urate, and in hyperurikemia is a fraction of neutral 17-ketosteroids, particularly dehydroepiandrosteron. 7 Figures, 2 Tables, 14 Western, 7 Czech references. (Manuscript received Nov 65).

Widerstandsgoelektrik für ein verlängertes Rotations-
ellipsoid. Mat.-Fyz. Casopis Slovensk. Akad. Vied
6 (1956), 109-129. (Czech, Russian and German
summaries)

The author presents an explicit solution for the electro-
magnetic field in infinite space, produced by a point
charge, which includes a homogeneous prolate spheroid
of distinct conductivity. He establishes the convergence
of expansions for the internal and external potential, as
well as for its derivatives normal to the surface of the
spheroid. The given solutions are, moreover, shown to be
unique. The field-producing charge can be located inside
or outside the spheroid. Z. Kopal (Manchester).

AUTHOR: Kolbenheyer, Tibor

TITLE: Representation of the gravitational field of homogeneous bodies by surface integrals

SOURCE: Matematicko-fyzikalny casopis, no. 3, 1961, 223-237

TOPIC TAGS: gravitational field, surface integral, homogeneous body, Mehler formula, Gauss theorem, Green theorem, Legendre function

ABSTRACT: Calculation of the gravitational field of various homogeneous bodies consists usually of an exact or approximate numerical or graphical evaluation of volume integrals:

$$U = k \int_S \frac{d\sigma}{R} \quad \vec{F} = k g \int_S \frac{R d\sigma}{R^3} \quad (1)$$

where U is the potential, vector F is the intensity of the gravitational field

Card 1/3

L 18892-63

ACCESSION NR: AP3005991

D

at any point P(x,y,z), k is the gravitation constant, ρ is the density, V the volume of the body, and R is the radius vector of point Q (x_1, y_1, z_1) moving between the integration limits referred to P, $R=PQ$ being the distance measured from P. For the purpose of gravimetical interpretation it is important to calculate also higher derivatives of the potential with respect to x,y,z. The article shows that volume integrals (1) as well as corresponding volume integrals of the higher derivatives of the potential can always be transformed into surface integrals over the surface of the body. As a result, the number of integrations which must be performed in order to determine the gravitational field is reduced by one. Both the potential and field intensity can be expressed as surface integrals through application of Gauss' and Green's theorems. The method is further extended to the second derivative and is finally generalized for higher order derivatives of the potential. In polar coordinates the solution involves Legendre functions. A sphere is considered and also a polyhedron. In the latter case, the field intensity can be expressed in terms of the potentials of all its sides according to Mehler's formula.

TITLE: Computation of the gravitational field of two-dimensional bodies by means of curvilinear integrals

SOURCE: Matematiko-fyzikalnyj obozrevatel', no. 4, 1964, 301-316

TOPIC TAGS: integral calculus, gravitation field

Abstract (Author's Russian summary, modified): In a previous article the author worked out the theoretical principles for solving the direct problem of gravitational prospecting, based on the computation of the gravitational field of any homogeneous three-dimensional body by means of integrals on its surface. In the present work the theoretical principles of representation of the fields of homogeneous two-dimensional bodies by means of integrals along their contour have been worked out. Fundamental formulas have been derived and their validity is proved empirically. The formulas are proved only for the external region and for the case of one attracting body. Orig. art. has 39 formulas and 3 graphs.

"Clinical Pathology of the Necrotic Inflammation of Kidney Pelvis Leukoplakia."

Budapest, Magyar Sebeszet, Vol XVI, No 2, May 1963, pages 125-129.

Abstract: [Authors' German summary] The cases presented are of clinical and literary significance. In the first of the cases, the kidney was retained during the first operation since it showed no significant changes. The mucosa of the pyelum showed macroscopic evidence of a chronic inflammation without an indication of leukoplakia. Therefore, only the tissue mass was removed and the kidney retained. During the second operation, the changes characteristic of chronic pyelonephritis were evident. Because of the advanced macroscopic picture of leukoplakia of the pyelum, removal of the kidney was indicated. The second case, presenting a similar picture, was solved by nephrectomy. 5 Western references.

TITLE: Automatic control for a neutron spectrometer

PERIODICAL: Nukleonika, v. 7, no. 3, 1962, 193-196

TEXT: A brief description is given of an automatic control and data recording system for a neutron crystal spectrometer used for neutron scattering and total cross-section measurements. The system provides for a fully automatic control of the spectrometer operation following a predetermined experimental program, comprising: change of the spectrometer turn-table angles, removing and inserting samples for background runs etc., as well as timing the exposures, operating and resetting the scalers and operating the data print-out. The latter includes information concerning the spectrometer settings, the time of exposure and the scalar readings. There are 2 figures.

Title : Consideration of temperature adjustment in processing
readings of depth manometers of the MG design

Periodical : Neft. khoz., v.33, no.3, 48-49, Mr 1955

Abstract : The author points out the present incorrect method of
ascertaining temperature corrections which lead to mis-
takes in calculating well bottom pressure by depth
manometers of the MG design. He presents formulae for
accurate calculating and illustrates his method in an
example.

SOV/91-58-2-14/31

AUTHOR: Kolbin, A.I., Engineer

TITLE: On Balancing the Rotors of Electric Motors
(O balansirovke rotorov elektrodvigateley)

PERIODICAL: Energetik, 1958, Nr 2, p 20-21 (USSR)

ABSTRACT: Reference is made to the nomogram published by L.G. Rubo in Nr 2 of Energetik, 1956, concerning the determination of the balancing-load's test weight for a certain restricted group of electric motors. The author shows that by introducing some small changes, Rubo's nomogram can also be used for all kinds of motors having any rate of revolution and any radius of suspension load. An example shows

Card 1/2

SOV/91-58-2-14/31

On Balancing the Rotors of Electric Motors

that, by using the adjusted nomogram, it was possible to lower the bearing-vibration of a motor from 0.3 to 0.03 mm. There are 2 diagrams, 1 graph and 1 Soviet reference.

Sulfate minerals from Stalingrad. M. V. Kudin.
Zapiski Vsesoyuz. Mineral. Otdelovaniia (Izdat. pri
russ. mineral.) 77, 322-3 (1948).—Spongy aggregates,
3 to 4 mm. in diam., of white or yellowish color, with a
rough surface, and glassy border, nearly entirely sol. in
water (reduces quartz) had d. 1.80; n below 1.64, bire-
fringent, pos. elongation of fibers. Chem. analysis gave
 SO_4 39.34, Al_2O_3 19.14, MgO 1.77, CaO none, K_2O 0.30,
 Na_2O 2.44, H_2O 38.48, loss. 3.00, Cl 0.30%. The cation of
this analysis shows a mixt. of two parts K alum, one part
of kaolinite, $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot 10\text{H}_2\text{O}$, and two parts of
aluminite, $(\text{Na}, \text{Mg})\text{Al}(\text{OH})_5 \cdot 22-24 \text{ H}_2\text{O}$. This mixt.
is a typical season product, formed in summer, dissolved
in winter by rain and snow. Pliopenko (1927) described
a similar season mineralization from Sodolov Mt. near
Kursk. The SO_4 is derived from circulating waters in
the sandstones of the middle Barapta horizons, which in
distinct horizons come to the surface and have a strongly
bitter taste. Analysis of such a water well shows:
120.2 mg./l. of Cl ; 96.8 NO_3^- ; 214.6 Ca^{+}
73.9 Mg^{+} ; 10.87 Al ; 8.9 K , and 0.02 Na (calcd.). There
is an essential difference from the compn. of the minerals
mentioned above: CaAl_2 is entirely absent in the latter
mixt., and NaCl scarce, but alumina much enriched.
Probably, the minerals are derived from the weathering
sands, of pyrite in the water-bearing horizons, and these
sands reacted with feldspars, amphiboles, and other
minerals forming Al sulfate. Gypsum and NaCl were
removed by salts, and the characteristic alum-like mixt.
was formed. W. Kiel

Galenite in Triassic sediments of Mt. Bogdo-Ula. M. F. Kolbin and N. I. Tikhonova (N. G. Chersky Institute Univ., Barnaul). Zapiski Vsesoyuznogo Mineralogicheskogo Seta, 222-3 (1955).—Sedimentary Pb-Zn ore deposits, of the type Meckersfeld (RhineLand), Upper Silesia, and Cu sandstones of Mottman (England) and the River Lena Basin, are highly important. The widespread occurrence of galena in Paleozoic sediments of the Russian platform, the phosphorites of Podolia, etc. are perfectly analogous to those in Mesozoic formations of Mt. Bogdo-Ula. The porous structure of the greenish gray limes zones is caused by the rich fossils; doluses with water-clear crystals of dolomite and analcime are directly visible in the binocular microscope, and galenite in polished sections, besides clastic terrigenous sedimentary minerals. The galena grains 0.5 to 8 mm. in diam. are easily isolated by HCl from the carbonate rock; Sb, Zn, and Ag could not be detected by micro-chem. tests.

TITLE:

Karst Phenomena in the South Primor'ye

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 3, pp 586-589
(USSR)

ABSTRACT:

At the beginning, the authors give a list of publications on karst phenomena in the Primor'ye (Pacific Coastal Area) which have been known there for 50 years (V. K. Arsen'yev, Ref 1; F. M. Derbek et al, Refs 2, 3; Krapotkin, Ref 4; Ye. A. Korostovtseva, N. A. Lebedeva, Ye. T. Shkatov, V. N. Yakovlev). When the second author had detected bauxites which were connected with old karst, greater attention was paid to the latter. The present paper gives a more perfect characteristic of these phenomena in the Chernigovka and Spassk Rayon. Among the 4 series: Cm₁, Cm₁₋₂, Cm₂, and Pz₃, the karst is bound to the two latter series. Its principal forms are: old caves (up to 760 x 230 m), funnels of different size, as well as small cavities and cracks. The bottom of the funnels has a rather complicated surface. In the lower part, the funnels are filled with brown-red karst loam (1-1.5 m) which is covered by

Card 1/3

Karst Phenomena in the South Primor'ye

SOV/20-128-3-42/58

karst breccia (15 - 16 m thick). The breccia is covered by diluvial deposits (Fig 1). Figure 2 shows a karst funnel. Figure 3 illustrates the incrustation of a lime breccia with secondary calcite. The bauxite breccia is to be found in caves (up to 25 m in size) of the paleo-karst, in their upper part. It is a very solid dark-green, brownish-shaded rock with inclusions of splinters of Cambrian light-gray lime. In the depth, the breccia passes into a light-gray and dark-green (until black) massive bauxite rock of boehmite-diasporelike composition with an Al_2O_3 -content up to 39%. The depth reached by karst phenomena exceeds considerably the recent ground-water level. This gives evidence of the old age of the karst formation. At present, the age of the karst can be hardly determined in each individual section. The beginning of karst formation might be assumed for the Salairskaya folding phase. The conclusion of karst formation is even more difficult to be determined. It can only be asserted that the karst formation was concluded in the beginning Upper Paleozoic. The paleo-karst, on its part, is not of the same age. A recent stage of karst formation evidently began in the post-Tertiary period, and is still

Card 2/3

Karst Phenomena in the South Primor'ye

SOV/20-128-3-42/58

lasting now. The clarification of the karst age is important for the clarification of the dependence of bauxite formation on a certain stage so that prospecting can be directed to the proper way. There are 3 figures and 4 Soviet references.

TITLE: Investigation of the change in the length of diffusion displacement of the carriers and the electrode potential of germanium during electrolytic treatment

PERIODICAL: Fizika tverdogo tela, v. 3, no. 5, 1961, 1553-1556

TEXT: The authors studied the change in diffusion displacement of the carriers and the electrode potential of germanium on anodic and cathodic polarization in various electrolytes. The samples were treated with an CP-4 (SR-4) etching agent and with H_2O_2 . The experimental setup is shown

in Fig. 1. The diffusion length of the carriers was measured by a light probe on the outer side of the sample. The samples used (thickness: a few tenths of a millimeter) were n-type and p-type germanium foils with a resistivity of 10 ohm.cm. Their (111) planes were exposed to the respective electrolytes (aqueous solutions of NaOH, KOH, NaCl, KCl, Na_2CO_3 , and HCl). Figs. 2 and 3 show the dependence of the electrode potential φ

Investigation of the change in ...

(in volts) (lower curves) and of the diffusion length L_D (upper curves) on the current flowing through the electrolyte for n-type and p-type germanium, respectively, for the case of an NaOH molar solution. The sharp rise of the electrode potential in n-type Ge from 10 mA/cm² onward is due to the fact that the kinetics of the anodic dissolution of germanium is limited by the diffusion of holes to the surface. In this range of currents, the electrochemical oxidation of the germanium surface plays a significant role. Since a change in diffusion length was observed in the case of alkaline electrolytes only, the authors conclude that the formation of a potential barrier at the boundary between germanium and electrolyte is related to the specific character of the action of the OH⁻ ions upon the surface of germanium. The authors thank Academician A. A. Lebedev and Professor P. L. Myuller for their interest in this study. There are 3 figures and 3 references: 1 Soviet-bloc and 2 non-Soviet-bloc. The reference to an English-language publication reads as follows: W. Brattain, C. Garrett. Bell. Syst. Techn. Journ., 34, 129, 1955.
