7572:

Kolibiarová, Blanka. On the semigroups, every sub-semigroup of which has a left unit element. Mat.-Fyz. Casopis. Slovensk. Akad. Vied 7 (1957), 177-182. (Slovak. Russian and English summaries)

2

I-FW

Let S be a semigroup and $J(S)$ the set of all idempotents $\in S$. An L -semigroup is a semigroup in which each subsemigroup contains a left unit element. A semigroup S is an L -semigroup if and only if S is a class sum of disjoint torsion groups, and $J(S)$ is an L -semigroup.

The structure of right ideals of an L -semigroup is studied. In fact, every right ideal of an L -semigroup S is at the same time a two-sided ideal of S . (An analogous statement for left ideals does not hold.)

The problems discussed are generalizations of or related to some problems treated by N. N. Vorob'ev. [Dokl. Akad. Nauk SSSR 88 (1953), 393-396; MR 14, 718].

TITLE: Product of semigroups

SOURCE: Matematicko-fyzikalny casopis, no. 4, 1965, 304-312

TOPIC TAGS: group theory, mathematic transformation

ABSTRACT: The article studies the structure of defined semigroups and gives some
special cases of those semigroups. The direct product of the semigroups also is
shown to be a special case. [Orig. art. in Eng.] [JPRS: 34,780]

"A Contribution to Knowledge of Repeated Blood Transfusions
in Horses."

Belgrade, Veterinarski Glasnik, Vol 17, No 3, 1963, pp.
231-238.

Abstract: /Author's German summary modified/ Repeated blood transfusions can be given without danger to the recipient if the serum of the latter has been established in advance not to agglutinate the erythrocytes of the donor. The blood mixture and the length of the interval since the previous transfusion are factors of no importance in such cases. Isohemagglutination prior to the second transfusion can be avoided if the transfusion takes place within four days from the same donor or 35 days after the preceding transfusion.

Tables, 10 references to recent German and Yugoslav works.

"A Contribution to Knowledge of Blood Groups in Horses and the Practical
Application Thereof."

Belgrade, Veterinarski Glasnik, Vol 17, No 9, 1963, pp 757-762.

Abstract: [Author's German summary modified] The author refers to his earlier statement that there are four basic blood groups (O, A, B, and AB) in horses, plus certain other factors (secondary agglutinogens and agglutinins). In the experiment discussed in this article, 56 pairs of horses were used, one in each pair as donor and one as the recipient of a transfusion of the same type blood. The results showed that secondary agglutinogens exist in the erythrocytes of certain horses to cause the formation of secondary agglutinins in the recipient between the fourth and seventh day after the transfusion of even compatible blood, such agglutinins disappearing within six to 28 days after transfusion. The question of the influence of the amount of transfused blood on the level of the titer of the secondary agglutinins remains open. Besides the basic blood groups, however, it is clear that certain subgroups exist in dependence upon the type of secondary agglutinogens and secondary agglutinins. Five tables, two Yugoslav and two German references.

TITLE: Geophysical investigation of unexplored areas of the Dzhezkazgan-Sarysuysk region

SOURCE: Ref. zh. Geofizika, Abs. 6D90

REF SOURCE: Sb. Geofiz. issled. v Kazakhstane. Alma-Ata, Kazakhstan, 1965, 120-126

TOPIC TAGS: petroleum geology, geologic exploration, oil, seismic logging, electric logging, geophysical exploration, oil deposits/Dzhezkazgan

ABSTRACT: Data obtained on the physical properties of rock in laboratory studies of samples and in electrical and seismic logging are presented. Geological and geophysical analyses showed that intense positive anomalies extending linearly along the meridional (up to 1000 km) are formed by iron quartzites, porphyritoides, and epidote and amphibole shales of the Karsakpay series. The area distribution

Card 1/2

of the electrical properties of the rock had not been sufficiently studied. The study of the polarization characteristics of rock and ore was begun only in 1961. Residual magnetization was studied principally in extruded and metamorphic rock. Geophysical investigations showed a block structure for the Dzhezkazgan trough—the synclinal region situated to the north of the Dzhezkazgan deposits. Geophysical studies and drilling operations revealed a rather wide distribution of halogenic formations, whose age was determined roughly as Permian. Thick Lower Paleozoic strata and overlying rocks with oil-bearing characteristics, salt dome tectonics, indications of oil in the gaseous and liquid phase in the Permian cross-section, and favorable structure, all indicate that the Dzhezkazgan-Sarysuysk trough is an oil-bearing region. **Orthogonal compensators of the magnetic field
inhomogeneities in a nuclear magnetic-resonance spectrometer**

V. V. Prolov,
A. I. Tsvetkov

(Russia)

A detailed discussion of the design of orthogonal compensators for stabilizing the magnetic field in a nuclear and a calculation of the main physical parameters of the system. Some experimental results are given. The current compensating currents in the two rings are of the order of magnitude as compared with the level by generating rings (V. V. Prolov, *Naukova Dumka*, 1961).

The absolute resolution attainable amounts to 0.3-0.5 cps in a field of about 17 gauss and a volume of 15 cm³. There are 2 figures and 1 table.

AUTHOR: Kolikov, V.M.

TITLE: Investigation of the state of macro-quantities of zirconium
in aqueous and nitric solutions

PERIODICAL: Zhurnal Prikladnoy Khimii, v 34, no 2, 1961, 248-258

TEXT: The state of zirconium in nitric acid solutions containing
0.1 - 0.5 mole/l ZrO₂ and greater amounts of ammonium nitrate was investi-
gated. This question is important since the effectiveness of the purifi-
cation of zirconium depends on the molecular form of zirconium in the
initial solution. In the present work molecular weight of zirconium poly-
mers was estimated by Langmuir's diffusion method (R. Connik, W.H. Reas,
Ref 18: J.Am.Chem.Soc., 73, 1171, 1951). Composition of the zirconium
complexes was determined by the method of distribution between two liquids
(butyl acetate, and solutions containing nitric acid and ammonium nitrate)

Card 1/6

Investigation of the state of macro-quantities... A057/A129

or by the optical method (measuring absorption spectra with a $\text{G} \cdot \text{I} \cdot \text{A}$ (SF-4) spectrophotometer at wavelengths of $240 - 350 \mu\text{m}$). In experiments concerning the effect of the concentration of hydrogen and zirconium ions on molecular weight of the polymers it was observed that at zirconium concentrations between $0.08 - 0.16$ mole/l almost all zirconium is present in form of polymers. Diffusion coefficient and molecular weight do not change considerably with the hydrogen ion concentration. Independently of H^+ and NO_3^- ion concentration an increase in zirconium concentration decreases the diffusion coefficient, i.e., the degree of polymerization increases, thus molecular weight of the polymers increases, too. The zirconium polymer can be represented by the chain $-\text{Zr}-\text{O}-\text{Zr}-$, where the free valencies can

be substituted by NO_3^- or OH groups corresponding to the composition of the solution. Investigations concerning absorption spectra of Zr in nitric acid solutions (Fig 1) demonstrated that Zr does not absorb light at wavelengths between $250 - 350 \mu\text{m}$ in aqueous solutions of $\text{ZrO}(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O}$ (0.324 mole/l ZrO) containing NH_4NO_3 (0.648 g-ions NO_3^- per liter 2). The

Card 2/6

25383

S/080/61/034/002/002/025

Investigation of the state of macro-quantities... A057/A129

absorption curve shows a maximum corresponding to NO_3^- ions. Using 8 M NH_4NO_3 with or without addition of NH_4NO_3 , a new light-absorbing group is formed when $\text{ZrO}(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O}$ is added (Fig 2). Investigations of the effect of concentration of Zr, NO_3^- and H^+ ions on optical density demonstrated that in aqueous solutions optical density is determined only by the NO_3^- concentration. The authors assume the presence of Zr^{4+} , $\text{Zr}(\text{OH})^{4-n}$ ions or

polymers ...-Zr-O-Zr-O-Zr..., none of which absorb light. The observed

linear function of optical density from H^+ ions concentration can be explained by a decrease of the degree of hydrolysis of zirconium, thus the number of Zr-OH bonds decreases and the possibility for the formation of Zr- NO_3^- bonds increases, i.e., optical density increases. The effect of $c_{\text{NO}_3^-}$, c_{H^+} on the distribution coefficient D_{Zr} was determined and a square function between D_{Zr} and $c_{\text{NO}_3^-}$ and a function of the degree 2.8 - 3 for $D_{\text{Zr}} = c_{\text{H}^+}$ was obtained. Thus the formula for the compound extracted from

Card 3/6

25383
S/080/61/034/002/002/025

Investigation of the state of macro-quantities... A057/A129

the aqueous phase can be written $(\text{ZrO})_n(\text{NO}_3)_{2n}$ and the reaction for the transfer into the organic phase is represented by

$$\text{ZrO}^{++} + 2\text{NO}_3^- + m\text{OP} \rightleftharpoons \text{ZrO}(\text{NO}_3)_2\text{MOP} \quad (\text{MOP} = \text{equilibrium concentration of the extractant}).$$

It is assumed that both types of compounds, i.e. $\text{ZrO}(\text{NO}_3)_2$ and polymer chains with dominant NO_3^- groups, pass into the organic phase. In the presence of excessive NO_3^- -ions these attach to zirconium and thus the whole chain passes into the organic phase.

Concluding the author thanks S.Ye. Brasler (in whose laboratory this work was carried out) for advices, and Yu.V. Teryayeva for helping in the experiments. There are 12 figures, 3 tables and 19 references: 6 Soviet-bloc and 13 non-Soviet-bloc. Three of the English-language publications read as follows: W.B. Blumenthal, Ind. Eng. TITLE: Separating zirconium and hafnium during the extraction of their nitrates

PERIODICAL: Zhurnal prikladnoy khimii, v. 34, no. 12, 1961,
2605 - 2609

TEXT: The effect of HNO_3 concentration in solutions of Zr and Hf nitrates on their separation by extraction with organic solvents was investigated. The solvents used were iso-amyl alcohol, amyl acetate and butyl acetate. As starting material $\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$ was used and was converted to the nitrate by precipitation with NH_4OH and by subsequent solution in HNO_3 . The amounts of extract zirconium were determined either gravimetrically or calorimetrically, the concentration of Zr being expressed as ZrO_2 g/l. Hafnium was determined by a radioactive method. These determinations were occasionally checked by spectral analysis. Details of the spectral analysis

Separating zirconium and hafnium ...

method are given in full. The degree of separation was evaluated by distribution coefficients D and a separation coefficient α defined by

$$(D_{Zr} = \frac{C_{Zr\ org}}{C_{Zr\ aq.}} \text{ and } D_{Hf} = \frac{C_{Hf\ org}}{C_{Hf\ aq.}} = \frac{N_{org}}{N_{aq.}})$$

X

where N is the number of impulses in a unit time in an equal solution volume and C is the concentration. The separation coefficient α is equal to the ratio D_{Zr}/D_{Hf} . The results of these investigation

for all the three solvents are given. In all the cases investigated, D rose with increasing acid concentration, the efficiency of separation slightly increasing in the series iso-amyl alcohol-amyl acetate - butyl acetate. The authors also studied the effect of Zr concentration in the starting solution, in the range of 10 to 90 g/l, on D and α and found that D decreased with the rise in Zr concentration. The results are discussed in the light of previously obtained data concerning the formation of zirconyl nitrate polymers

Separating zirconium and hafnium ...

in aqueous HNO_3 solutions. It is thought that with the rise of HNO_3 concentration compounds of the type $(\text{ZrO})_n(\text{NO}_3)_{2n}$ are formed which after solvation migrate into the organic phase. The lowering of D with rising Zr concentration is explained by the rise in molecular weight of Zr polymers which takes place under these circumstances, thus hindering the migration of Zr salt into the organic solvent. The results have shown the relative stability of coefficient α where Zr extractability is low and its decrease when the latter is increased. The increase in HNO_3 concentration which raises the Zr extractability at the same time reduces the difference between Zr and Hf. Effect of fluorine-containing complexes on the extractability of zirconium
tributylphosphate

SOURCE: *Zhurnal prikladnoy khimii*, v. 36, no. 1, 1963, p. 111

TOPIC/TAGS: Fluorine, zirconium, tributylphosphate, potassium fluorozirconate

ABSTRACT: In studies on the effect of the conditions of preparation of nitrate zirconium on its extractability in tributylphosphate, it was found that extractability was associated with significant amounts of fluorine. Zirconium was precipitated from solutions prepared from potassium fluorozirconate. The zirconium was precipitated from an aqueous solution of potassium fluorozirconate under the conditions of refluxing in nitric acid, filtration of the solid residue, and molecular exchange ions in the solution after the addition of a suspending agent and led to partial substitution of the hydroxyl group by a sup-

TITLE: A method of improving antifriction properties of cast-iron
and steel surfaces

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 19, 1962, 39,
abstract 19B215P (Hungarian Patent, cl. 48 d., no. 148167 of
March 31, 1961)

TEXT: A patent was issued for a method imparting antifriction properties
to cast-iron or steel surfaces of parts. A particular feature of the method
is the spraying or application by galvanic means of Cu, Cr, Ni, Ag, Mo, In, Pb,
Zn or Sn metal in a 1 - 40 micron layer onto the surfaces. The part is then
placed in a hermetically sealed bath with sulfur compounds and is held there
for 0.5 - 8 hours at 200 - 800°C. The bath may be composed of solids or molten
salts; the sulfur diffuses from these substances into the part to 1- 300 micron
depth, forming sulfides. Subsequently the parts are cooled down to 100°C and
washed in hot water during 10 - 15 minutes. After drying they are heated in oil

Slices of human myocardium 0.5-1 cm. in thickness are incubated in a medium of sodium malate and potassium tellurite at pH 8.9. Normal myocardium appears black, whereas the colour of infarcted myocardium remains unchanged. The principle of the reaction resides in the demonstration of (malic) dehydrogenase with reduction of potassium tellurite to metallic tellurium. Infarcts of the human myocardium by losing their malic dehydrogenase can be demonstrated by this macroscopic technique as early as 7 hr. after onset of clinical symptoms.

ABSTRACT: This single or multistage tubular air heater is distinguished by the feature that the inlet part of the tubes or pipes intended for the passage of waste gases along the longitudinal axis are so funneled out that they touch each other to form the outside edge. The funneled inlet part has, advantageously, the form of the inlet of a Laval nozzle.
