TITLE: On the Regularities of Changes in the Weight per Unit Volume of Rocks in Their Weathering Profile (O zakonomernosti izmeneniya ob'yemnogo vesa gornyx porod v profile ikh vyvetrivaniya)

PERIODICAL: Dopovidi Akademii nauk Ukrain'skoi RSR, 1958, Nr 4, pp 430-433 (USSR)

ABSTRACT: Investigations by B.B. Polinov, I.I. Gizburg and others have established typical weathering profiles which develop in magmatic and metamorphic rocks. The commonly used characteristics of these profiles are mineralogical on the one hand and chemical on the other. However, these characteristics are not sufficient, for physical characteristics are of importance for engineering investigations. Papers by B.M. Mikhaylov [Ref. 5] and V.Yu Kondrachuk [Ref. 2] dealt with these problems. The author studied the ancient weathering crust of the Volyn' gabbro-labradorite massif and some other parts of the Ukrainian crystalline shield and established a certain regularity of the changes in the volumetric weight of the skeletal part ( i.e., completely dehydrated specimens) of the rocks for the kaolin profile of weathering: this weight decreases

Card 1/2

SOV-21-58-4-18/29

On the Regularities of Changes in the Weight per Unit Volume of Rocks  
in Their Weathering Profile

successively along the cross section of the crust upwards, from 2.7 and 3.05 g/cm<sup>3</sup> to 1.26 and 1.45 g/cm<sup>3</sup> on the zone of complete kaolinization. The curves of changes in the volumetric weight well reflect the non-uniformity of the course of chemical weathering and structural changes of the rocks. The data obtained indicate enormous dimensions of erosional losses in the processes of formation and transformation of the weathering crust which escaped previous quantitative estimates. There is 1 set of graphs and 6 Soviet references.

TITLE: Hypsometric Chart of the Surface of the Precambrian Foundation  
of the UkrSSR and Some Adjacent Areas (Skhema gipsometrii  
poverkhnosti dokembriyskogo fundamenta USSR i nekotorykh  
sopredel'nykh territoriy)

PERIODICAL: Dopyvidi Akademii nauk Ukrain's'koi RSR, 1958, Nr 8, pp 863-866  
(USSR)

ABSTRACT: The old charts of the Precambrian foundation within the Ukraine  
compiled by A.D. Arkhangel'skiy (Ref. 1) and other investigators,  
of which the most detailed is the chart by E.E. Fotiadi (Ref. 15)  
are mostly obsolete and do not correspond to the present level  
of the geologico-geophysical knowledge of the Ukraine terri-  
tory. Making use of charts compiled by F.A. Rudenko, G.M.  
Kozlovskaya, V.T. Syabryay, K.M. Varava, R.I. Andreyeva for  
individual regions and based on the results of electro-surveys  
by V.I. Klushin, gravimetric investigations by S.I. Subotin  
and prospecting drilling, in 1957 the authors compiled a hypso-  
metric chart of the surface of the Precambrian crystalline

Card 1/2

SOV-21-58-8-16/27

Hypsometric Chart of the Surface of the Precambrian Foundation of the UkrSSR and Some Adjacent Areas

foundation of the Ukrainian SSR and certain adjacent areas on a scale of 1 : 750,000. The contemporary surface of the Precambrian foundation has a peculiarly disjointed relief which in its fundamental features accords with the features of the tectonic structure of the areas considered. There is 1 geological chart and 16 Soviet references.

"Ascariasis with Complications"

Budapest, Magyar Sebészet, Vol 19, No 3, Jun 66; pp 181-185.

Abstract: The surgical significance of *Ascaris lumbricoides* and the literature data are discussed. The complications caused by the worm are discussed on the basis of the author's own cases, consisting of two instances of *Ascaris* in the bile duct, one intestinal perforation caused by *Ascaris*, one instance of severe toxicosis, and one instance of ileus verminosus. In the sixth case the worm caused postoperative insufficiency of the intestinal suture. (17 References, predominantly Eastern).

TITLE: Application of the Amperometric Method for the Analysis of Chromites and Chrome-magnesite Refractory Materials (Primeneniye amperometricheskogo metoda dlya analiza khromitov i khromomagnezitovykh ognepornykh materialov)

PERIODICAL: Izv. AN KazSSSR. Ser. khim., 1957, Nr 1, pp 45-50

ABSTRACT: The amperometric titration method with a rotating Pt microelectrode is employed for the determination of Cr, FeO, and Fe<sup>total</sup> in chromites, rock, and chrome-magnesite refractory materials. The fundamental basis of the method is the electrode reaction, namely, the oxidation of Fe<sup>2+</sup> at an E=+1.0 v in relation to the Hg iodide comparison electrode (E=+0.02 v). Under certain conditions Mn, Cr, and V do not produce any electrode reactions. For the determination of Cr and Fe<sup>total</sup> the weighted test sample is fused with a mixture of Na<sub>2</sub>O<sub>2</sub> and Na<sub>2</sub>CO<sub>3</sub>. The melt is leached out with water and the Fe(OH)<sub>3</sub> is filtered off, the precipitate is dissolved in hot 2N H<sub>2</sub>SO<sub>4</sub>, the solution is reduced with metallic

SOV/137-57-11-22704

Application of the Amperometric Method (cont.)

Bi and an aliquot part thereof is titrated with 0.1N or 0.01N K bichromate solution. The Cr is determined in the filtrate. After the removal of  $H_2O_2$  the solution is neutralized with  $H_2SO_4$  and a sufficient excess of the latter is added to make the concentration of the acid in the solution correspond to 0.1N. Cr is titrated with a Mohr-salt solution. For the determination of Fe  $\text{O}$  10 cc of the solution ( 1 liter contains 4 g of  $V_2O_5$  and 100 cc of 1:2 mixture of phosphoric and sulfuric acids) are evaporated to the incipient crystallization of the salts after which 10 cc of a mixture of phosphoric and sulfuric acids are added, the mixture is again heated to dissolve the salts after which 0.1 g of test sample is introduced. When the test sample is completely dissolved the solution is titrated with Mohr's salt.

TITLE: Some results of the postflight examination of P. I. Belyayev and A. A. Leonov following their flight on the Voskhod-2 spacecraft [Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24 to 27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 36-37

TOPIC TAGS: space medicine, postflight medical examination, bodily fatigue, body weight, cardiovascular system, oculocardiac reflex, unconditioned reflex, space psychology, oxygen consumption, respiration, pulmonary ventilation/Voskhod-2

ABSTRACT: Postflight examinations of the Voskhod-2 crew members, Leonov and Belyayev, were performed on the third and fourth days after the flight and again a month later. The cosmonauts complained of light fatigue. They were found to have hyperemia of the mucosa of the nose and throat and conjunctivitis of the eyelids and eyeballs. They had lost weight

Card 1/3

L 08262-67

ACC NR: AT6036481

Their pulse showed a certain lability. Pulse frequency rose significantly during mild physical exertions and changes in the position of the body. There was an increase in intraventricular conductivity, an increase in the systolic index (7-11%), and a delay in restoration of hemodynamic indices after physical exercise.

Belyayev's oxygen consumption increased by 23% and Leonov's by 14% as compared with preflight levels. Vital capacity of the lungs diminished by 8-12%, while pulmonary ventilation increased by 51-18%.

Neurological examinations revealed a light tremor of the fingers, a high orthostatic reflex with an absence of pulse reaction to the oculocardiac reflex, and an increase in the slow bioelectrical activity of the brain cortex. Psychological tests revealed an increase in distribution and in the middle magnitudes of the duration of the period of sensory motor reaction. Since this was not accompanied by errors, it is possible to assume that the fatigue observed in cosmonauts was a compensatory reaction. Blood and urine examination on the third day after flight did not differ substantially from preflight levels. Biochemical examination uncovered an increase of chlorides, adrenalin, noradrenalin, and 17-oxy corticosteroids in the urine.

Card 2/3

L 08268-67

ACC NR: AT6036481

The observed shifts in physiological indices were short-term and reversible. They indicated the development of moderately marked fatigue in the subjects. Thus, despite the complexity of the flight, the postflight examinations revealed only moderate functional changes in the two cosmonauts. There was no difference in the nature of these changes in the cosmonauts. This indicates a high degree of training and a good neuropsychological and physical preparation for spaceflight.

Title : On the Problem of the Reclamation of Saline Soils for Cotton Plants Under the Conditions of Kara-Kalpakiya

Orig Pub : UzSSR fanlar akad. aqhbortl. Izv. AN UzSSR, 1956, No 3, 19-25

Abstract : In 1953-1954, experiments were conducted at the Kara-Kalpakskaia Experiment Station on cultivation of saline lands with their utilization for cotton plant. On saline soils where ground waters are at the depth of 2.5 meters and deeper, good results were produced by supplementary (besides the spring irrigation) vegetative waterings with the norm of 100-1200 cubic meters per hectare.
