TITLE: Determining the Maximum No-Load Current of Transformers and the Charging Current of 110- and 35-kv Lines Cut by Type RLN Disconnects

PERIODICAL: Naladochnyye i ekaperim. raboty ORGRES, Nr 15, 1958, pp 156-163

ABSTRACT: To determine the possibility of adopting the substation schemes without circuit-breakers on the high-voltage side, ORGRES jointly with large power systems (Lenenergo, Mosenergo, and others) staged tests intended to determine maximum currents and thereby maximum power of transformers and also maximum length of a transmission line that could be reliably cut off at no-load by a type RLN disconnecting switch. In addition to visual observations, a cinema filming was made which permitted determining the duration of arcing; to determine accurately the moment of arc extinction in relation to the angle of the disconnecting blades, both the current being interrupted and the blade

Card 1/2

SOV/112-59-5-8849

Determining the Maximum No-Load Current of Transformers and the Charging . . .

movement were recorded by an oscillograph. Overvoltages set up by cutting off no-load lines were not measured. The tests enable one to draw the following conclusions: The voltage, maximum transformer capacity, and transmission-line length which could be cut off at no-load can be considerably increased over those specified by the PTE MES standards. No-load currents as high as 7 amp for 20-Mva, 38-kv transformers and 10 amp for 31.5-Mva, 110-kv transformers can be cut off by a RLN disconnect. It is recommended that the disconnects be operated on or off quickly. Pole separation of the disconnect should not be less than 2,500 mm for 110 kv and 1,200 mm for 35 kv. To determine the maximum no-load length of 35- and 110-kv lines that could be cut off by the disconnect, overvoltages accompanying the line interruption need to be studied.

An allergic skin reaction as an index of immunity in plague

Periodical : Zhur. mikro. epid. i immun. 4, 40-47, Apr 1955

Abstract : The effectiveness of an allergy skin reaction as an index of the immunity produced by a live anti-plague vaccine was investigated. A killed vaccine made from strain Ye V plague bacteria grown in a simple agar culture medium was used as the antigen. Pestin was used as the allergen. The results of the experiments are presented on five charts. No references are cited.

pestis allergens for intradermal reaction in individuals vaccinated by different
methods

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 10, 1965, 30-35

TOPIC TAGS: human ailment, bacterial disease, bacteria, vaccine, immunization

ABSTRACT: The authors noted immunobiological and allergic reconstruction in individuals who had recovered from plague. The Past. pestis allergens studied proved to be heat- and acid-resistant with no toxic or immunogenic properties. Live plague vaccine altered body reactivity, reflected not only in the development of resistance to plague but in allergic reconstruction to plague bacteria and fractions isolated therefrom. Immunity in the vaccinated persons and animals resulted in increased skin reactivity to the injection of pestin. This phenomenon can be used to evaluate the immunological changes occurring in the body after immunization with live vaccine. A positive intradermal reaction to pestin is an indication of immunity to plague. It occurred in almost all those vaccinated twice and

in 50% of those vaccinated once. These results are consistent with the experimental data obtained on guinea pigs inoculated with live vaccine. They showed that immunity is completely developed within 6 or 7 days despite the presence of live microbes in the organs, i. e., during the nonsterile phase of immunity. Orig. art. has: 3 tables. TITLE: Effect of certain culture conditions on the virulence of the plague microbe

SOURCE: Zh mikrobiol, epidemiol i immunobiol, no. 6, 1966, 146

TOPIC TAGS: microbiology, plague microbe, epidemiology, ~~environmental conditions~~
bacterial disease, disease control, bacteria

ABSTRACT:

Culture conditions affect the virulence of the plague microbe. Highly virulent cultures were passaged on agar under differing conditions. The virulence of strain 708 for mice decreased 20 times after five to ten passages through agar. On synthetic media the number of pigmented colonies decreased. This suggested that after many passages on nutrient agar or synthetic media, the succeeding generations of microbes become increasingly more adapted to the media than they are to the host organism.

TITLE: Hydraulic Follow-Up Systems for Tracer-Controlled Machines and the
Fundamentals for Designing Such Systems

PERIODICAL: V sb.: Avtomatizatsiya v mashinostr. M., Mashgiz, 1957,
pp 89-117

ABSTRACT: Equations are analyzed that describe the motions in hydraulic follow-up systems of tracer-controlled machines: various types of machines with differential and nondifferential power cylinders, with flow-through, with two-edge, and one-edge slide valves. An approximate method for computing parameters of such systems is suggested; the method is based on linearized equations of motion. Influence of the system parameters upon its stability is investigated by means of the Vyshnegradskiy diagram for systems of the third

Card 1/2

SOV/112-59-1-1201

Hydraulic Follow-Up Systems for Tracer-Controlled Machines and the

order in dimensionless coordinates without allowance for friction forces, and by means of an Andronov and Mayyer diagram in the same coordinates with an allowance for friction forces. From these diagrams, the system stability range and the velocity limit gain can be determined. The influence of the drooping friction characteristic upon the follow-up-system stability is investigated. It is recommended that damping be introduced at various points of the follow-up system to increase system accuracy at high speeds of piston motion. Data for selecting damper parameters is submitted. Twelve illustrations. Bibliography: 6 items.

TITLE: The influence of dry friction in guiding rails on the stability of the hydraulic follow-up systems in automatic cutting machines

PERIODICAL: Avtomatika i telemekhanika, v. 22, no. 9, 1961, 1253 - 1256

TEXT: In the present article the authors analyze the problem of stability and of dry friction in the follow up systems in these installations on a strictly theoretical basis. For increased accuracy in determining the behavior of the system in an oscillatory state, the saturation characteristics of the piping is introduced as conditioned by the finite pump output. In solving the problem, use was made of the electronic analogue (MN-M). To evaluate the accuracy of the results obtained the same analogue was used to obtain the solution of the Vyshnegradskiy problem which was in complete agree-

The influence of dry friction ...

ment with the solution of this problem given by A.A. Andronov and A.G. Mayer. The present article is restricted to analyzing the influence of dry friction and that of saturation resulting from the finite output of the pump. The linearized equation of the system with linear input function, i.e. with constant velocity of the probe without friction, has the form of

$$L \frac{d^3 \delta}{dt^3} + M \frac{d^2 \delta}{dt^2} + D \frac{d\delta}{dt} + E = D \frac{dy}{dt} + R. \quad (1)$$

In it L - a factor characterizing the influence of compressibility of the fluid and elasticity of piping; M - the mass of the working part of the machine; D - the coefficient of internal damping; E - stiffness coefficient; R - the constant component of cutting speed; δ - copying error; y - coordinate of the probe tip; $\delta = y - x$, where x - coordinate of the moving part of the machine. The analysis of stability of such a system reduces to the Vyshnegradskiy problem in the theory of servos without power amplification. The

authors reduce the system to a dimensionless form of

$$\ddot{x} = \tau \dot{\xi}, \quad P = \tau M \sqrt{\frac{E_1}{L_2}} \psi, \quad P_{\tau} = \tau M \sqrt{\frac{E_1}{L_2}}, \quad t = \sqrt{\frac{L}{E}} \tau. \quad (5)$$

where ξ and ψ are dimensionless coordinates of the system and τ a dimensionless time. Since the pump output is finite, the velocity of moving arm cannot exceed

$$\dot{x}'_{\max} = \frac{Q_p}{F} \quad (6)$$

where Q_p - is the pump output and F - the area of the piston. Eq. (6) in dimensionless form can be written as

$$\left(\frac{d\xi}{d\tau}\right)_{\max} = \tau_{\max} = \frac{Q_p \sqrt[3]{\frac{L}{E}}}{F\gamma} \quad (7) \quad \checkmark$$

The values of parameters ultimately obtained are shown as a family

of curves in Fig. 2b with the limits of stability shown in Fig. 2a for various initial displacements of cutting head from neutral. The same Fig. 2 shows the hyperbola of Vyshnegradskiy (Curve A, Fig. 2b) and the limits of stability region as obtained by A.A. Andronov and A.G. Mayer (Fig. 2a). It is stated in conclusion that the results by Andronov and Mayer (Ref. 2: Zadacha Vyshnegradskogo. v teorii pryamoregulirovaniya (The Vyshnegradskiy Problem in the Theory of the Control without Power Amplification) Avtomatika i telemekhanika, v. VIII, no. 5, 1947) cannot be applied directly to the problem of stability of a hydraulic follow-up system of an automatic cutting machine, if the dry friction has to be taken into account, and that the analysis of such a system with the limitation introduced by the finite output capability of the pump, has produced conditions for absolute stability as a function of its parameters and of the pump output. There are 2 figures and 4 Soviet-bloc references.
