Simple method for determining Arsenic in Ascorbic Acid

A. L. LEVINE, JOURNAL OF PHARMACEUTICAL SCIENCE, 1953, 42, 1033.

Precipitate 20 ml. of must in a beaker with 10 ml. of 10% zinc chloride, as excess of phenolphthalein. This will precipitate arsenic trioxide. Add 8 ml. of 10% potassium hydroxide and heat until the colour is bright orange-red.

Filter off the precipitate and wash it with 10 ml. of 10% potassium hydroxide.

Transfer the precipitate to a test tube and add 1 ml. of 10% sodium hydroxide and 1 ml. of 10% potassium hydroxide. Dissolve the precipitate in 10 ml. of 10% potassium hydroxide. Transfer the solution to a 50 ml. conical flask, and dilute the liquid into the conical flask. Heat the beaker and titrate malic acid with 0.1 N alkali hydroxide with phenolphthalein as indicator. Find the indicator correction place in a little 4 beaker. 1 ml. of solid KCl, 20 ml. H₂O, and 8 ml. of 10% potassium hydroxide to a noticeable pink, with phenolphthalein as indicator. To 6 g. malic acid, dissolve the titrator in the 3 test tubes in 25 ml. hot H₂O and transfer into the breaker where ppm was carried out. Heat to complete soln. and titrate with 0.1 N alkali hydroxide. The method gives satisfactory results.

J. M. H.

U.S.S.R.

Chemical analysis of wine. A simple method to determine lactic acid in dry wines. A. V. Karpov
Sukharev. Vinogradnoye vino. M. S. 1955 No. 1, 44 (1955). To 3 ml wine add 5 ml cold water
and 2-3 drops of indicator (for white wines phenolphthalein
and for red ones phenolphthalein and litmus). Titrate the mixture with
NaOH until titration 4 ml and 1 ml excess NaOH. Add 1 ml
acetic acid and dilute back to 10 ml. The titration is now complete.

Another method: 1. Add 1 ml of 0.1N HCl to 10 ml wine. After 10 min titrate the mixture with 0.1N NaOH. The titration is complete when the color of the indicator disappears. The amount of HCl used multiplied by 10 gives the amount of volatile acidity of wine in meq/l. 2. Add 1 ml of 0.1N NaOH to 10 ml wine. After 10 min titrate the mixture with 0.1N HCl. The amount of HCl used multiplied by 10 gives the amount of volatile acidity of wine in meq/l. In both cases a correction has to be made for the presence of bromophenol blue.

Korotkovich, A.

An accelerated method for the determination of tartaric acid in raw materials containing tartaric acid. A. V. Korotkovich and L. M. Bekrova. Sadosadstvo, Vsesoedinstvo i Vsesobie Molodosti 10, No. 2, 45 (1955).—Add 0.5 g. of a raw material containg tartaric acid (I) into a 200-ml. beaker followed by the addn. of 40 ml. 10% K₂CO₃ and boil the mixt. for 12 min. with continuous stirring. After chilling, transfer the reaction mixt. into a 100-ml. volumetric flask with distd. water, fill to the mark, and filter. Pipet three 10-ml. samples into 50-ml. Erlenmeyer flasks; add to each sample 0.5 ml. concd. AcOH, 20 ml. 90-6% alc., and 0.5 g. powd. KCl, and let the mixt. stand in a cold place for 2-3 hrs. Collect the ppt. of K bitartrate (II) on a quant. filter paper, (or by centrifugation) wash the residue, and the filter 4 times with 10 ml. std. KCl, dissolve the residue in 50 ml. hot distd. water, bring the soln. nearly to a boil, and titrate while hot with 0.1N NaOH with phenolphthalein as indicator. When the amt. of I in the raw material being analyzed is lower than 25% repeat the data by condensing the 10-ml. sample to 3 ml. before the addns. of AcOH, alc., and KCl, resp. Since 1 ml. 0.1N NaOH in the case of II is equiv. to 0.015 g. of I, it follows that the percent of I (X) in the material analyzed is equal to $X = (0.15 \times 100A)/3 = 2.64$, where A = the amt. of the 0.1N NaOH soln. used up for the titration of the 10-ml. sample soln. TITLE: Ternary aqueous systems consisting of potassium, rubidium and cesium chlorates at 25°C

1 27 27

H

SOURCE: Zhurnal neorganicheskoy khimii, v. 10, no. 5, 1965, 1225-1228

TOPIC TAGS: potassium chlorate, rubidium chlorate, cesium chlorate

ABSTRACT: The solubility of $KClO_3-CsClO_3-H_2O$, $KClO_3-RbClO_3-H_2O$, and $RbClO_3-CsClO_3-H_2O$ ternary systems at 25°C is studied (see fig. 1 of the Enclosure). The selective titratable method for analyzing potassium, cesium and rubidium systems is discussed. The method of isothermal desupersaturation was used to study the solubility. In the first system, no solid solutions were formed between potassium chlorate and cesium chlorate, and only the liquid phase was analyzed. In the second system, both the solid and liquid phases were analyzed; no solid solutions were formed between potassium chlorate and rubidium chlorate. In the third system, the solid and liquid phases were also analyzed; rubidium chlorate and cesium chlorate

Card 1/4

I. 63568-65

ACCESSION NR: AP5012973

form a continuous series of solid solutions. The authors calculated the activity coefficients for RbClO₃-CsClO₃ solid solutions, using P. Schmeling's formula

$$\lg y_1 = - \int_{x_1}^{x_2} x_1 d \lg D_{11}; \quad \lg y_2 = - \int_0^{x_2} x_2 d \lg D_{22},$$

where $D_{11} = \frac{x_1 y_1}{y_2 x_1}; \quad D_{22} = \frac{x_2 y_2}{y_1 x_2}$.

The effect of composition on the logarithm of the activity coefficient is adequately described by equations from the theory of regular solutions

$$\ln y_1 = 1.79 x_1^2; \quad \ln y_2 = 1.79 x_2^2$$

The constant coefficient in these equations (1.79) is close to 2. In accordance with this, this means that RbClO₃-CsClO₃ solid solutions are close to ideal separation. The article has: 2 figures, 7 tables, and 7 formulas.

TITLE: Experimental rolling of bimetal sheets

PERIODICAL: 'Stal', no. 4, 1963, 343 - 346

TEXT: Tests were carried out at the Chelyabinskij metallurgicheskiy zavod (Chelyabinsk Metallurgical Plant) with the participation of N. P. Shchukin, V. D. Nikitin, S. A. Zuyev, V. P. Nikitin, N. N. Danilovich, N. V. Zerchaninov, V. V. Shturts, V. A. Ustimenko, V. V. Silant'yev, to establish the technology of bimetal sheet production. Symmetric (4-layer, 150 - 220 mm thick) and asymmetrical (3-layer, 135 mm thick) sheets were produced. The nickel coating was applied in some tests by the standard electrolytic method, in some tests, however, a new process was employed with a special apparatus, involving the melting of a 1.5-mm diameter nickel wire, which was thereupon applied to the sheet surface by pulverization. Prior to this the surface to be coated was shot-blasted. A 600 x 1,750 mm sheet could be coated by this process with a 40 μ thick nickel layer.

AUTHOR: Korotkevich, B. S.

TITLE: The development of synthetic rubber production

PERIODICAL: Zhurnal Vsesoyuznogo Khimicheskogo Obshchestva im. D. I. Men-deleyeva, v. 6, no. 1, 1961, 69-74

TEXT: The author summarizes the problems facing the synthetic rubber industry in the Soviet Union during the current 1959 - 1965 Seven-Year Plan. The sodium butadiene rubber production should be discontinued and replaced by the production of polydivinyl rubber of regular structure. Polyisoprene rubber is to be produced in various plants. Emphasis is placed on the need to develop the production of monomers. The Giprokauchuk in designing new plants is concentrating on: 1) increasing the plant output, 2) increasing the output of individual units, 3) applying new, more complex technological processes, 4) automating the processes, 5) cooperating with related plants, 6) rational solution of general plans, 7) compact arrangement of production equipment, 8) placing the equipment outside the buildings. Isoprene monomer will be produced from formaldehyde and isobutylene in some plants and by de-

The development of synthetic rubber production

hydration of isopentane in others. It is shown that the pentane method of isoprene production shows the greatest promise. The separation and the packing of the polyisoprene rubber is another problem. It is up to the Nauchno-issledovatel'skiy institut khimicheskogo mashinostroyeniya (Scientific Research Institute of Chemical Machine-Building) to organize and lead the main operations in developing new types of equipment for the production of isoprene rubber. The Soviet Union has realized the two-stage production of divinyl from butane on an industrial scale, the first stage being the dehydration of normal butane to butylenes and the second the dehydration of butylenes to divinyl. Projects of three different plants for this production have been designed by Giprokauchuk. In order to further improve the technical and economical indices of divinyl production from butane, the following measures should be undertaken: 1) perfection of the two-stage process; 2) organization of the single-stage process (i.e., the direct dehydration of butane to butadiene). Experimental work and designing of the equipment are being carried out in these two respects. The most promising method for the production of butadiene is thought to be the single-stage dehydration of butane under vacuum. In order to realize the single-stage process it is important for the

The development of synthetic rubber production

Showed that these units are practical at a production capacity of over 20 t/hr of pyrolysis material per unit. The Giprokauchuk is developing a unit with an hourly output of 60 thousand nm³ of gas and the Giprogastoprom a unit with 30 thousand m³ of gas. Emphasis is placed on the need for designing the following effective machines and apparatus: 1) high-economy turbo-compressors for compressing hydrocarbon gases to a pressure of 20 - 40 atm, 2) a detander for expanding the hydrogen methane fraction in high thermal drops, 3) boiler-utilizers for using the heat of the pyrogas, 4) a continuous pyrolysis unit of high output, 5) heat-exchange apparatus for condensing steam-gas mixtures, 6) plates for precise rectification, 7) pumps without stuffing boxes for pumping the compressed hydrocarbon gases. The following problems must be dealt with: 1) removal of acetylene compounds from the pyrogas, the ethylene and propylene fractions, 2) development of the industrial production of drying agents for the pyrogas and the ethylene and propylene fractions, 3) a study of the phase equilibria in the systems: ethylene-ethane (1 - 30 atm), propylene-propane (1 - 25 atm), hydrogen-methane-ethylene (20 - 40 atm), methane-ethylene (1 - 40 atm), 4) development of analyzers for the analysis of admixtures in commercial ethylene and propylene fractions of high purity. There are 5 tables.

TITLE: Agents Provocateurs and Slanderers Working
(Provokatory i klevetniki za rabotoy)

PERIODICAL: Radio, 1957, Nr 7, pp 63-64 (USSR)

ABSTRACT: A booklet "Subversive Propaganda Centers of the US in Europe"
(Podryvnyye propagandistskiye tsentry SShA v Yevrope) by G. Gurkov and Ya.
Shevrov, "Znaniye" Publishing House, Moscow, 1957, is reviewed in the article.
The booklet is welcomed and highly praised. It criticizes the work of the
"Voice of America", "Radio Free Europe", "Liberation", and RIAS. The work is
lebeled as a "nefarious slander of the countries of socialist camp".
"White", "gray", and "black" types of the American radio propaganda, which is
"against socialism, against peace and democracy", are discussed. Lewis
Galantier is mentioned as a political consultant, and Harlow Curtis and Cecil
Morgan are mentioned as supporters of the "Free Europe" radio. Soviet escapees
and their stories are described as "inventions". German uprising of June 17,
1953, and Hungarian uprising of 1956 are partly blamed on the work of RIAS
and the "Free Europe".

TITLE: Solving nonlinear mathematical programming problems having one or more extrema on analog computers

SOURCE: AN SSSR. Izvestiya. Tekhnicheskaya kibernetika, no. 4, 1964, 81-90

TOPIC TAGS: computer programming, analog computer, nonlinear programming, mathematical programming, Pyne gradient method

ABSTRACT: The authors discuss Pyne's gradient method for analog computer solution of linear and convex programming problems from the standpoints of accuracy, speed and controllability. A monotonous convex function is considered, using a piecewise linear approximation, and an expression is derived for the time to solve a one-extremum programming problem using Pyne's method; the errors in the solution are also investigated. Using broad-band transistor amplifiers with a 100 ns time constant and 8-blocks having a 50 ns risetime, a linear or quadratic problem can be solved in less than 10 μ sec. Methods are next considered for reducing multiple-extremum problems to a finite set of one-extremum problems suitable for determinate solution (in contrast to the Monte Carlo approach). The block-diagram for solving the multiple extremum problem

TITLE: Iteration method of selecting control actions for bringing a plant into a specified state during a specified time

SOURCE: Avtomatika i telemekhanika, v. 25, no. 11, 1964, 1566-1571

TOPIC TAGS: automatic control, automatic control design, automatic control system, automatic control theory

ABSTRACT: An iteration algorithm for solving the problem formulated in the title is developed, for a wide class of nonlinear systems. Control actions are selected by expanding their expressions into known functions and by finding the expansion coefficients through minimization of a certain functional. The method permits varying the parameters one after another, which simplifies practical procedures and is the only possible technique for handling complex problems.

2

The algorithm is illustrated by an example of rapidly bringing a gyro compass to the meridian; an electronic simulator with some auxiliary devices is used. The system is brought to the origin of coordinates by a step force $q(t)$ by the time moment T ; the force is switched at $t = T/2$; force steps b_1 and b_2 are sought. The process of finding a solution in the parameter space is shown; the system stability is explored; crudity of the system with respect to variations of the parameters of the iteration device is established. "In conclusion, the authors would thank Ya. N. Royterberg for suggestion of the topic, and I. P. Chernov for his assistance in the work." Orig. art. has: 6 figures and 22 formulas.

"Protection of Surface Engineering Installations of Salt Mines From Karst Deformations," Tr. Vses. N.-i. in-ta solyanoy prom-sti, No 1, 32-38, 1954

The author indicates practical (negative) significance of the fact that, as a result of the pumping out of water from salt mines, there develop in the salt karst hollows and channels leading to the formation of funnels and craters and of sags in the surface of the earth. He notes the necessity for the presence of three factors for the process of karst formation: (1) dissolvable rocks; (2) movement of water; and (3) dissolving capacity (aggressiveness) of the water. Heretofore, the struggle against karst formation has been directed against the second factor.

ABSTRACT: The author describes a new method whose use in certain cases makes it
possible to increase the influx of water into mine workings or artificially
decrease the water permeability of soil and rocks. The article gives the method
of air drainage. The method, its theoretical basis, and variants of its
application are described in detail. The method involves introduction of air into
soil to decrease permeability, which is done by injecting air into
pores and capillaries by air bubbles. The method has never
been used in practice and the article itself is published for discussion

ACCESSION NR: AY4049253

purposes. The principle involved is essentially as follows: If air particles are injected into a water-bearing horizon a three-phase system will appear: solid matter - liquid - gas. Surface tension develops at the discontinuities. The surface tension of gas bubbles introduced into the pores and capillaries gives the system a plasticity similar to small air-filled rubber balloons. As the bubbles move through the variable cross section of the capillaries they will be deformed by the resistance to the movement of water. The surface tension of the water - air interface will be dependent on the mineral composition of the water and the degree of increase of its mineralization. The degree of decrease of filtration will be dependent on the size of the pores, their shape and the variability of their size, the angularity of the rock grains, strength of the gas bubbles, hydrophobic properties of minerals and other characteristics of the rock. Solid, liquid and liquid. Orig. art. has 6 figures.

TITLE: Fauna of the Late Tripolye Settlement of Sandrak (Fauna
pozdnetripol'skogo poseleniya Sandraki)

PERIODICAL: Zbirnik prats' zool. muzeyu UkrSSR, 1956, Nr 27, pp 130-
143

ABSTRACT: The author describes the fauna from an excavation at the
Late Tripolye settlement of Sandrak in the Khmel'nitskiy
rayon of the Vinnitskaya oblast'. The site is on the
right bank of the Yuzhnnyy Bug River (on the second ter-
race above the flood-plain). In all, more than 1500
bones and fragments were collected here. They belong
to domestic animals (ox, pig, horse, dog, and goat or
sheep) and to wild animal (urochs, elk, red deer, roe
deer, wild boar, bear, fox, badger, both rock and wood
marten, beaver, hare, hamster, and moles). Also dis-
covered were two species of birds (capercaillie and

Card 1/2

Fauna of the Late Tripolye Settlement of Sandrak (Cont.)

black grouse), three species of fish (carp, sheatfish, and pike), toads, and stream tortoises. This faunal assemblage indicates a forest-steppe landscape and a dominance of hunting in man's economy. It also indicates that a great change has occurred in the fauna of the region since Late Tripolye time.

TITLE: Reactions of telomerisation of organic cyclosiloxanes with titanium tetrachloride

PERIODICAL: Zhurnal obshchei khimii, v. 32, no. 7, 1962, 2311-2314

TEXT: The reaction of octa-methyl-cyclo-tetra-siloxane with titanium tetrachloride was studied with the aim of elucidating whether the products of the reaction would include, besides α -chloro- ω -trichloro-titanoxy-octa-methyl-tetra-siloxane, also other telomers. It was found that when octa-methyl-cyclo-tetrasiloxane was made to react with $TiCl_4$, at molar ratio 2:1, two compounds were obtained: α -chloro- ω -trichloro-titanoxy-octa-methyl-tetra-siloxane; and a higher telomer, the analysis of which corresponded to the formula $C_{16}H_{48}O_8Si_8TiCl_4$. The yields were 42.4% and 8.51% respectively. The higher telomer is a yellow liquid sensitive to humidity. It could be distilled only under high vacuum at 133-135°C. It is considered to be bis-(chloro-octa-methyl-tetra-siloxane)-dichloro-titanium. The reaction of $TiCl_4$ and tri-methyl-tri-phenyl-cyclo-trisiloxane did not result in the formation of a telomer. Usually poly-titano-methyl-phenyl-siloxane polymer was obtained. At a higher temperature, at 170°C a polymer corresponding to the formula $C_{63}H_{72}O_{10.5}Si_9TiCl_4$ was formed. There is 1 table.

Title : Significance of Neuro-Receptor Zones in Rabies and the Creation of Antirabies Immunity in Experimental Animals.

Orig Pub : V sb.: Osnovy imuniteta, M., 1956, 107-117

Abstract : Mice were infected hypodermically in different receptor zones by a 10% brain suspension, containing a fixed rabies virus (500 Dlm). The most effective proved to be an infection in the pad surface of the anterior extremity (death of all animals). The majority of mice died also upon infection of the tail and inner surface of the hip. The lowest rate of disease was among animals infected in the spine, forehead region, and buttocks. The author suggests infection of the anterior extremity as a method for testing resistance of mice immunized by

Card 1/2

Abs Jour : Ref Zhur - Biol., No 3, 1958, 9684

antirabies vaccine. In hypodermic rabbit immunization by Fermi vaccine in different receptor zones, the animals frequently experienced a shock reaction ending in death. The greatest number of reactions were noted when the vaccine was introduced into the pad surface of the anterior extremity. Resistance of surviving rabbits to a brain infection by a fixed rabies virus also differed. The most resistant were animals immunized in the anterior extremity. An increased resistance was noted as the vaccine dosage was increased. When vaccine was introduced consecutively into different receptor zones of the same animal, a diminished number of shock reactions was observed and an increased resistance to the subsequent infection by a fixed virus.

TITLE:

The Zooplankton of the Indian Sector of the Antarctic
(Zooplankton Indiyskogo sektora Antarktiki)

PERIODICAL:

Doklady Akademii nauk SSSR, 1958, Vol 121, Nr 6, pp 1009-1011
(USSR)

ABSTRACT:

The material for this paper was collected by the authors during the second voyage of the Morskaya antarkticheskaya ekspeditsiya (Naval Antarctic Expedition) on board the "OY" in the time from January to April 1957. This paper deals with the zooplankton collected south of the subantarctic convergence between 20° and 97° of eastern longitude. The majority of the stations was located more south than 60° southern latitude. The authors used 640 samples, 550 of which were quantitative, and they investigate the peculiarities of the biological seasons in the Antarctic plankton and the connection of its distribution with the distribution of the water masses, especially the connection of the fauna boundaries with the boundaries of the water masses, the influence of the structure of the Antarctic divergence on the

Card 1/3

The Zooplankton of the Indian Sector of the Antarctic SOV/20-121-6-15/45

accumulations of the eupauziidae and the influence of an intermediary cold water mass on the vertical distribution of the zooplankton. The earliest spring state of the Antarctic zooplankton was found in the extreme south in the immediate neighborhood of the ice ($69^{\circ}46'$ southern latitude, $20^{\circ}19'$ eastern longitude, February 21). The authors then discuss a later spring state. The summer state of the plankton was found in the eastern part of the investigated region near 59° of southern latitude towards the end of January and in the western part (on the northern side of 68° southern latitude) towards the end of February. Much detailed information is then given. In the Antarctic, the copepodae have plenty of food until the beginning of the fourth copepoda stage. Great accumulations of Euphausia superba were found towards the North of Enderby Land. The Antarctic and the boreal Calanus have an essentially different vertical distribution. The boundary between the tropical and the anti-boreal regions at 20° eastern longitude had a very complicated structure. The boundary of the antiboreal and of the antarctic regions at $20^{\circ}30'$ was, however, very sharp and it had a simple structure. At 97° of eastern longitude, its structure was somewhat more complicated. There are 7 references,

AUTHOR:Korotkevich, V. S.TITLE: The Distribution of the Plankton of the Indian Sector of the
Antarctic (Raspredeleniye planktona indiyskogo sektora Ant-
arktiki)PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 122, Nr 4, pp 578-581
(USSR)ABSTRACT: This paper deals with 779 samples which were collected by
means of nets during the second voyage of the Kompleksnaya
antarkticheskaya ekspeditsiya AN SSSR (Complex Antarctic
Expedition AS USSR) on board the Diesel-electric ship "Oh'".
These samples were collected by the author together with K.
V. Beklemishev in the Indian Ocean during the time of from
January 14, 1957 to April 19, 1957 at 125 stations from the
layer 0 - 500 m. The plankton was collected and treated by
the same methods as in the first voyage (1956). These inves-
tigations comprised the Antarctic, the southern temperate,
and partially the tropical biographic regions; they were
carried out in the period from the early biological spring
to late fall. The antarctic region was investigated very

Card 1/3

SOV/zo-122-4-10/57

The Distribution of the Plankton of the Indian Sector of the Antarctic

thoroughly. The presence of *Calanus acutus*, *Calanus propinquus*, *Rhincalanus gigas*, *Metridia gerlachei*, *Euphausia superba* et al. is characteristic of this region. The first 3 species were more numerous than the other ones, and *Rhincalanus gigas* has the widest distribution. The author then names the species which are characteristic of the southern temperate region. The tropical region is characterized by a numerical scarcity and by a great variety in species of the plankton. In the boundary zones between the biogeographical regions, the above-mentioned species are mixed because of the intense vorticity of the water masses. The plankton is distributed more or less homogeneously in the water layer from 100 to 0 m. The maximum values of the plankton weight were found in the region between $60^{\circ}30'$ and $66^{\circ}33'$ south latitude and between 76° and 89° east longitude. The minimum weight of the plankton was observed in the region of antarctic divergence, in some places of the convergence regions, and also in the tropical region. The vertical distribution of the plankton was inhomogeneous. The greatest quantities of plankton were found in the superficial layer down to 50 m. In the deeper layers, plankton density decreases. In the period

Card 2/3

SOV/20-122-4-10/57

The Distribution of the Plankton of the Indian Sector of the Antarctic

of biological spring, the stratification of the plankton was very distinct. The maximum development of the algaplankton was observed in the antarctic region in the period of biological spring. A rough investigation of the above-given observation data gave the following result: The biological mass of the nutritive plankton of the investigated region (especially of the antarctic region) is noticeably higher than that of the north-western part of the Pacific. There are 2 figures, 1 table, and 5 references, 4 of which are Soviet.

PHASE I BOOK EXPLOITATION

SOV/5462

Sovetskaya Antarkticheskaya ekspeditsiya, 1955.
 Vtoraya morskaya ekspeditsiya na d/s "Ob" 1956-1957 gg. i drugie rezhimy formal'nye
 (Second Marine Expedition on the Diesel-Electric Ship "Ob", 1956-57; Sci-
 entific Results) Leningrad, Naukova Dumka, 1959. 105 p. (Series: Iss.
 [Material] no. 7) 1,200 copies printed.

Sponsoring Agency: Mezhdunarodnyy geofizicheskiy fond, i Arktycheskiy i
 antarkticheskiy nauchno-issledovatel'skiy institut.

Ed. (Title page): I.V. Makarov, Doctor of Geographical Sciences, Professor;
 Ed.: Ye. I. Ozerova; Tech. Ed.: O. I. Kotlyarova.

PURPOSE: This book is intended for marine geologists and hydrologists.
 COVERAGE: This is a collection of 9 articles on the hydrogeological and geo-
 logical findings of the Second Soviet Marine Expedition, sponsored by the
 Arctic and Antarctic Scientific Research Institute of the Ministry of Geophysical Work,
 Merchant Marine or the USSR as part of the diesel ship "Ob" during 1956-57.
 The expedition, conducted on the coast of Antarctica between 0 and 120°
 program, the entire Indian Ocean and the coast of Africa in a series on the
 covered, the seventh and last in investigating the
 east longitude. The present volume, the seventh and last in investigating the
 Second Expedition, describes the work of the Expedition in investigating devices;
 following: The geomorphology of the sea bottom, by means of sounding devices;
 the geological structure and profile of the East Antarctic waters and the
 southern part of the Indian Ocean, through the collection of bottom deposits;
 the seismic-geodetic determination of the thickness of friable bottom of the
 the seismic-geodetic determinations; the relief of the bottom of the ocean, the
 analysis of surface and depth suspensions; the Gauss-Mercator projection and
 Berlese Sea and the area north of it; the Gauss-Mercator projection and Queen Mary
 continental slope areas of Antarctica between 80° and 100° east longitude and
 40 and 70° south latitude; the geomorphology of Queen Maud Land and Queen Mary
 Coast; glacier examination; seasonal quantitative and qualitative longitudinal
 distribution of plankton in the Antarctic sector of the Indian
 and latitudinal distribution of seals, birds, fish, marine parasites,
 and aquatic fauna, including whale seals, birds, fish, the Institut
 Oceanograficheskogo issledovaniya, the Institut zoologii AN SSSR, Institut zoologii AN
 oboroni i gospromostroya SSSR (Institute of Oceanology AS USSR), Zoologicheskiy institut AN
 SSSR (Institute of Geography AS USSR), Zoologicheskiy institut AN oboroni i gospromostroya (Institute
 of Fish Industries and Oceanography). No personalities are mentioned. Each
 article is accompanied by references.
