TITLE: 144-Channel Neutron Time-of-Flight Analyzer Designed to Work with a Mechanical Selector

PERIODICAL: Nukleonika, 1959, Vol 4, Nr 2, pp 221-225 (Poland)

ABSTRACT: A description of the equipment with block-diagram (Fig. 1) of the 144-channel neutron time-of-flight analyzer is given. Furthermore the equipment is illustrated with and without case (Fig. 2,3, and 4). The range of application is outlined in brief. Extract of technical specifications: 1) and 2) number of channels; 3) width of channel of analyzer; 4) stability of width of channel; 5) impulse starting, amplitude, continuance of time, polarization; 6) retarding change of starting impulse; 7) analysis impulse, amplitude, continuance of time, polarization; 8) efficiency of separation of channel; 9) register of analyzer channel; 10) working conditions; 11) size. There are 3 photographs and 1 diagram. ✓

TITLE: Conditions for growing germanium crystals in thin films
PERIODICAL: Fizika tverdogo tela, v. 3, no. 11, 1961, 3541-3543

TEXT: Conditions were studied for the growth of large germanium crystals possible in thin films. The material was vacuum evaporated at about 10^{-5} mm Hg; plates of quartz, graphite, and other substances were used as substrates. n-type germanium with a resistivity of $10 \text{ ohm} \cdot \text{cm}$ was evaporated. The rate of increase in the thickness of the films was about 100 \AA/sec . The temperature of the substrate was varied between 500°C and 1000°C . The melting point of germanium and the thickness of the germanium films from 1 to 20μ . Between 500 and 800°C polycrystalline films with crystals of about 0.1μ and less were formed; at 900°C grain size was about 1μ . There was no noticeable increase in grain size after 3 to 6 hrs annealing at 600 - 900°C . To find the recrystallization temperature of Ge a second quartz plate was layed on top of the one with the germanium film. This system was heated to 960°C . The germanium layer only melted at a few

places, where drops were formed. Microscope analysis showed that the drops formed plane single crystals with diameters of 100-200 μ . The fine grain structure of germanium was preserved at distances of 200 μ or more from the drop. This means that the recrystallization temperature of Ge is close to its melting point. Several hours annealing at 900-958°C produced single crystals of up to 2 mm in diameter and 1-20 μ thick. Like the starting material, these relatively large crystals also had n-type conductivity. TITLE: Determination of nitrogen content in α -SiC by EPR technique

SOURCE: Zavodskaya laboratoriya, v. 31, no. 12, 1965, 1450-1451

102
B

TOPIC TAGS: silicon carbide, EPR, Hall effect, nitrogen, single crystal

ABSTRACT: An attempt was made to use EPR technique for determining nitrogen content in single crystals of hexagonal silicon carbide (α -SiC). The method is based on determining the number of paramagnetic centers (nitrogen atoms) in a crystal sample by comparing its EPR spectrum with the spectrum of a reference sample ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$). Both spectra were taken at the liquid nitrogen temperature with a PE 1301 radiospectrometer. The relationship between the concentration of the free charge carriers at room temperature as determined from the Hall effect (n_{Hall}) and the concentration of non-compensated and non-ionized nitrogen centers at the liquid nitrogen temperature (N_{EPR}) is:
$$N_{\text{EPR}} = 4.87 n_{\text{Hall}}$$
. All the experimental results obtained with silicon carbide samples

with various nitrogen contents are to the right of the $N_{EPR} = 4.87 n_{Hall}$ line (see fig. 1). This indicated that EPR technique gives only the concentration of the non-compensated nitrogen centers while the technique based on the Hall effect is indiscrimin-

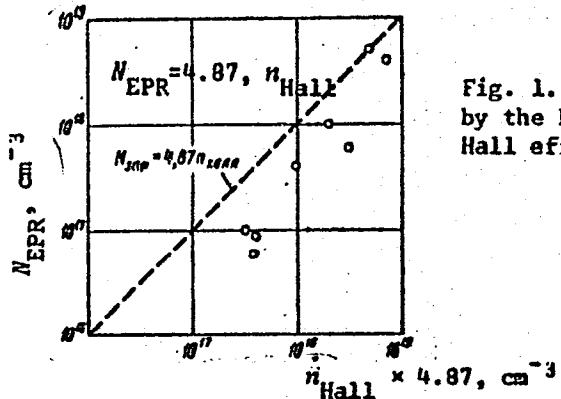

Fig. 1. Comparison of the results obtained by the EPR technique and on the basis of Hall effect.

tive (gives all non-compensated ionized donor centers). The accuracy of the EPR technique is better by one-half of an order of magnitude. The EPR technique is recommended as a rapid method of determining nitrogen content in silicon carbide crystals.

TITLE: Experiments on growing crystals of germanium in thin layers.

PERIODICAL: Kristallografiya, v.7, no.5, 1962, 773-779

TEXT: Layers of germanium were obtained by vacuum evaporation onto substrates of different materials (quartz, graphite, steel etc). The influence of temperature and the material of the substrate on the dimensions and the form of the crystals were studied. The temperature region of recrystallization of germanium in thin layers was established. By the choice of annealing regime and substrate the dimensions of grains could be increased by some $(1 \text{ to } 2) \times 10^4$ times. The importance of the perfection of very thin layers of germanium from an electrical point of view is considerable. Ge was evaporated at a pressure of about 10^{-5} mm Hg from a basket of W wire. The substrates could be heated during and after evaporation to 1000°C if necessary. The usual rate of evaporation was 1 micron/min and the final thickness 1 to 20 microns. It was found that the

On permeability and allergy. P. Stern and R. Kohak
(Acta med. Fenn., 1951, 8, 147-158).—With a modification of
Hahn's apparatus (Arch. exp. Path. Physiol., 1938, 228, 1 and 212), the
permeability of abdominal muscles of small mammals was studied.
Permeability for Biinger's solution is reduced at the moment of contact
of sensitized membrane of abdominal muscle with homologous anti-
gen. Antigen does not prevent this reduction in permeability, i.e.
does not prevent antibody-antigen union. Histamine may reduce
permeability but never increases it. Intravenous injection of urea
offers a new way of testing permeability; the substance gradually
disappears from the blood after allergic reaction. The experiments
suggest that allergic reaction increases tonic of the cholinergic
nervous system.

AUTHOR: Kosály, György

TITLE: The Statistical Theory of Neutron Gas /9

PERIODICAL: Energia es Atomtechnika, 1960, Vol. 13, No. 4-5, pp. 233-236

TEXT: The present paper describes the behavior of stable particles moving in a non-multiplying medium. In view of the fact that parameters characterizing the gas-physical state of some particle are probability variables, and that their change in time is a stochastic process according to Markov, the second Kolmogorov-Feller equation is derived, which is identical with the well-known kinetic equation. The collision number is also taken into account as a variable of this equation, as well as the possible local dependence of the macroscopic cross section on its position. After proceeding to the case of steady state, the author studies the case of the slowed down neutron. He determines the probability $p_N(u, \mu) \cdot du d\mu$ that, as a result of N collisions, the lethargy of a neutron changes by the value that is found within the range

TITLE: The impurity band in crystals of n type InP

SOURCE: Fizika tverdogo tela, v. 6, no. 5, 1964, 958-960

TOPIC TAGS: crystal, Hall constant, electron concentration, semiconductor band structure

ABSTRACT: This is a continuation of investigation in support of previous work (F. P. Kesamanlyz, E. E. Klotywn'sh, Yu. V. Mal'tsev, D. N. Nasledov, and Yu. I. Ukhanov, FIT, 6, 134, 1964), indicating that the increase in Hall constant in n-type InP with decrease in temperature below 200K is due to conduction in the impurity band. One of the consequences of an impurity band in a crystal is a maximum on the curve showing temperature dependence of the Hall constant. Investigation in the region of 2-300K of n-type InP with electron concentration of $8.2 \cdot 10^{16} \text{ cm}^{-3}$ has shown that the Hall constant increases as T declines down to 40-50K and then reaches a maximum, after which it begins to decline till the

TITLE: Microstructure of the fatigue-fracture of specimens of carbon steel structural elements

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 3, 1962, 26, abstract 3I151
(Wytrzymałość zmęczeniowa tworzyw i elementów metalowych". Warszawa,
1961, 170-175, Polish)

TEXT: A study was carried out, using an electron microscope, of the nature of the fatigue fractures of normalized steel with 0.38% C subjected to fatigue testing under alternate bending under stress exceeding the σ_w by 1 - 2 kg/mm². The investigation was carried out by means of 2-step colloid-carbon replicas, graduated Cr replicas, and straight carbon replicas. In a number of specimens the fracture occurs along the ferrite grain. Impact specimens after testing at -196°C have an analogous fracture. The fracture occurs along definite crystallographic planes when the critical stress is attained. The fracture begins at a nuclear crack and spreads in various directions. The microfractogram shows also characteristic protrusions having a definite crystallographic orientation. The

TITLE: Contribution to the study of methacrylacetone polymerization

SOURCE: Tehnika, no. 9, 1966, 1600-1604

TOPIC TAGS: polymerization, polymerization catalyst, methacrylacetone, methylmethacrylate, intrinsic viscosity

ABSTRACT: Radical type bulk polymerization of methacrylacetone was studied in the 0—100% conversion range at various temperatures (50, 60, 70 and 80C) and with different amounts of "a"-azo-iso-butyronitrile as polymerization catalyst

Card 1/2

(0.3%, 0.5% and 1%). The results are compared with those obtained for methyl-methacrylate polymerization. It was found that there is considerable similarity between the two processes with the rate of the former being considerably lower and the gel effect somewhat less pronounced. The change in molecular weight during polymerization was also investigated. The relation between the intrinsic viscosity and the molecular weight $[\eta] = KM^\alpha$ was assumed and the constants were found experimentally to be $K = 6.8 \times 10^{-5}$ and $\alpha = 0.8$. Molecular weight distribution function was obtained by fractionation of a sample of the polymer resulting from polymerization at 50° with 0.5% of the catalyst. Orig. art. has: 3 figures. Title : Viscosity, Electrical Conductivity, Refraction Index and Density of Binary Liquid Systems: Sulfuric Acid - Ethyl Ester, Sulfuric Acid - Amyl Ester and Phosphoric Acid - Ethyl Ester.

Orig Pub: Glasnik hem. drustva, 1955, 20, No 6, 349-361

Abstract: The viscosity, electronical conductivity and density of liquid systems H_2SO_4 - ethyl ester, H_2SO_4 - amylic ester and H_3PO_4 - ethyl ester at 25 and 40°, as well as the refraction indices of the binary systems of H_2SO_4 and H_3PO_4 with ethyl ester at 25° were measured. The viscosity curves of these systems possess a maximum owing to the formation of molecular compounds. The positive

APPROVED FOR RELEASE: 06/14/2000 CIA-RDP86-00513R000825020017-6

Abstract: divergence of refraction indices from the additivity rule and the computation of contraction confirm this conclusion. The electrical conductivity curves of mixtures of esters with H_2SO_4 show maximum values at high H_2SO_4 concentrations, while the electrical conductivity of the system H_3PO_4 - ethyl ester gradually drops from H_3PO_4 to ethyl ester. An equilibrium with the formation of compounds of the composition 1 : 1 is observed in the systems, but it is impossible to arrive at any conclusion regarding the formation of compounds containing one mole of the acid per two moles of the ester. The compound is more dissociated into components in the system H_2SO_4 - amylic ester than in the system H_2SO_4 - ethyl ester in consequence of the steric influence of the long alifatic chain. The compound in the system H_3PO_4 - ethyl ester is also less stable than the compound in the system
