Title : Calcium Sulfate Deposits in Ampule Solutions of  
L-Ascorbic Acid.

Orig Pub: Acta Polon Pharmc, 15, No 1, 45-50 (1958) (in Polish  
with English and Russian summaries)

Abstract: Calcium sulfate deposits formed in ampule solutions  
of L-ascorbic acid (I) because of the insufficient  
purification of I from the Ca compounds used in the  
course of the synthesis of the I and because of the

- The report concerns 311 cases of measles contacts from 6 months up to 14 years of age.  $\gamma$ -globulin was administered up to the 6th day after the contact with measles. The dose of 0.2-0.25 ml./kg. prevented the disease in 84.79%, in 9.56% it modified the course of the disease. Measles of a severe course was not observed. The dose of 0.1-0.15 ml./kg. prevented the disease in 85.25% and in 11.4% modified the course of the disease. 0.05 ml./kg. protected 50%. Out of 835 injected children 10 cases developed reactions. These were mainly of pyrogenic type but 2 anaphylactic reactions were noted.  $\gamma$ -globulin produced by the Institute of Haematology in Warsaw is as efficacious in preventing measles as the known foreign preparations.

AUTHOR: Kościuszko, Remigiusz  
TITLE: In Twardowski's Foot-steps,  
PERIODICAL: Skrzydlata polska, 1960, No. 22, pp. 4 - 5

TEXT: The article describes the interest in astronautics shown by youth at meetings organized by the Polskie Towarzystwo Astronautyczne (Polish Astronautics Association). However, the author points out that meetings are not enough. The youth wish to broaden their knowledge by building model rockets, etc, where the Association, owing to lack of funds and facilities, failed to undertake proper steps. He proposes that the Polish Astronautics Association in cooperation with the Boy Scouts, the APRL and other organizations, should organize a nation-wide net of clubs of young astro-pilots. Further, the article criticizes the Ministerstwo szkolnictwa wyższego (Ministry of Higher Education) for disbanding the rocket section at the Akademia górniczo-hutnicza (Academy of Mining and Metallurgy) in Kraków. It was expected that experiences on rocket

Title : Conductivity of Copper Tungstate

Orig Pub : Collect. Czechsl. Chem. Communs, 1959, 24, No 6, 2034-2037

Abstract : Sintered specimens of  $\text{CuWO}_4$  were used to investigate the dependence of the conductivity on the temperature. From this dependence, the energy of activation was calculated; on the basis of the analysis of the lines and the Debye patterns of certain conducting specimens of  $\text{CuWO}_4$ , the strength of the Cu -- O -- W bond is evaluated.

Title : Zinc Telluride as a Semiconductor

Orig Pub : Ceskosl. casop. fys., 1957, 7, No 4, 361-368

Abstract : An investigation was made of the properties of ZnTe as a semiconductor. The ZnTe was synthesized in pure nitrogen at a temperature of 800°C. The conductivity of zinc telluride was measured in a temperature range from 0 to 1400°C using a thin copper-zinc telluride-copper layer. Plots are constructed for the dependence of  $\log \sigma$  on  $1/T$  and the activation energy  $\Delta W = 3.94 \times 10^{-4} (\log \sigma_1 - \log \sigma_2) (1/T_2 - 1/T_1)$  electron volts is calculated and is found to be on the average 0.25 ev. No photoeffect was observed in zinc telluride. The thermal emf was measured with a method described by Frank (Referat Zhur Fizika, 1956, No 10, 29062) with a Cu-ZnTe contact. It turned out that the value of the thermal emf was 0.5 mv/deg. The conductivity is of P type. Bibliography,

Title : Zinc Telluride, A Semiconducting Compound

Orig Pub : Chekhosl. fiz. zh., 1957, 7, No 4, 468-475

Abstract : An investigation was made of the semiconducting properties of single crystals of zinc telluride, obtained by evaporation of ZnTe powder in vacuum. The procedure of making the single crystals is described and data are given on the temperature dependence of the conductivity. By measuring the thermal emf it was established that the conductivity of ZnTe is of the p-type. No photoconductivity was observed on the investigated specimens.

TITLE: The Semiconducting Properties of Copper Tungstate

PERIODICAL: Československý časopis pro fysiku, 1961, No.2,  
pp.133-140

TEXT: The semiconducting properties of tungstates have been inadequately studied. So far, the reactions during the formation of copper tungstate from metallic oxides have been studied and the diffusion processes at the contact between copper oxide and tungsten oxide (Ref.4: Tamman, G., Westerhold, F., Z.anorg.allg. Chem.35 (1925),149). Recently, the equilibrium between copper tungstate and hydrogen as well as the thermodynamic properties of copper tungstate have been studied (Ref.5). The electrical properties of sintered samples of copper tungstate were studied by the authors. The samples were prepared from sodium tungstate (Merck) and copper nitrate. From these, tungsten oxide and copper oxide were prepared. These were mixed and heat-treated at 800°C for 48 hours in oxygen. Samples 1 and 2 were prepared by this method while another two samples (3 and 4) were prepared by mixing the oxides into molten sodium chloride. The melt was held at

The Semiconducting Properties ...

820°C for 48 hours. After cooling, the powdered preparation was extracted in hot distilled water and washed in water several times. The samples were pressed at 15000 kg/cm<sup>2</sup> into cylindrical shape and heated in a quartz tube to 580°C for 4 hours in oxygen. After slow cooling, gold contacts were evaporated onto the samples. These electrodes proved ohmic between 0 and 1 Volt. The measurements on all samples gave identical and reproducible results. The conductivity  $\sigma$  of the samples was measured at a constant oxygen pressure of 750 mm Hg in the temperature range from 273 to 873°K. Fig.1 shows the results for the samples 1 to 4. The samples sintered at lower partial pressures (about 50 mm Hg) of oxygen showed higher conductivity than those sintered at atmospheric pressure of oxygen. An investigation of the dependence of the conductivity upon the partial pressure of oxygen was undertaken next. The measurements were taken only after equilibrium had been set up, i.e. after approximately 15 hours.  $\sigma$  was found to be a linear function of the partial pressure of oxygen. It can be expressed by the equation

$$\sigma = \text{const} \times p_{O_2}^{-\frac{1}{x}}$$

The Semiconducting Properties ...

where  $p_{O_2}$  is the partial pressure of oxygen. The values of  $x$  vary between 3.48 at 703°K and 4.96 at 856°K. We might speculate that the conductivity is due to either oxygen vacancies or to copper (or tungsten) ions or atoms in interstitial positions. In the monoclinic lattice, the second possibility seems rather unlikely. Assuming that the conductivity is due to the electrons from oxygen anions, we can calculate the conductivity as a function of partial pressure of oxygen and find that the probable mechanism is given by equation 1:

At higher temperatures, a second mechanism (equation 2) might come into action. This assumption is supported by the fact that the dependence of  $\log \sigma$  upon  $1/T$  changes at about 693 to 753°K (Fig.1). Measurements of the thermoelectric e.m.f. as a function of temperature supported the assumption that copper tungstate is an n-type semiconductor. The view that oxygen vacancies determine the conductivity of copper tungstate is in agreement with

Landsberg et al (Ref.11) and Pschera and Hauffe (Ref.12).  
The luminescent properties of cadmium tungstate also point to  
oxygen vacancies as the most likely defects in this substance,  
which is isomorphous with  $\text{CuWO}_4$ . There are 5 figures and

Title : The Use of a Turbine Mixer in the Preparation of Dough for Waffles.

Orig Pub : Prumysl potraviny, 1958, 9, No 6, 298-304.

Abstract : The application of a turbine mixer (TM) for the preparation of all sorts of dough for waffles was indicated. The great number of TM revolutions accelerates greatly the homogenization of the dough without reducing its quality. The use of TM permits the automatization of the process of dough preparation. -- R. Terekhin

2911. KOSEK M., KADERÁBEK F., TESÁŘÍK J. and KOSKOVÁ D. Int. Odd. OUNZ, Nemocnice, Příbrami. O inhibičním faktoru v seru karcinomatiků. Rozdíly v zábraně hemolysu saponinem u lidí zdravých a nemocných s maligními nádory. On the inhibitory factor in the serum of carcinoma patients ČAS. LÉK. ČES. 1956, 95/30 (810-816) Graphs 3 Tables 1

The inhibitory capacity was studied of human serum against haemolysis by saponin. A comparison was made of the inhibition in healthy subjects or patients suffering from non-neoplastic diseases with the inhibition of sera from patients suffering from established malignant proliferation and suspected malignant disease. It was found that in 86.65% of cases of carcinoma there are registrable changes as against normals. Non-specific positive results were obtained in 15% of the normal group. It was proven by the authors that human serum, inactivated by heat, has a capacity to inhibit haemolysis by a solution of saponin, without itself having a haemolytic effect. The authors' method made more accurate could be employed as a diagnostic test of malignancy.
