TITLE: Calculating Filtration Through Screens Based on Their Water Permeability (Fil'tratsionnyy raschet zaves s uchetom ikh vodopronitsayemosti)

PERIODICAL: Gidrotekhnicheskoye Stroitel'stvo, 1958, Nr 4, pp 31-34 (USSR)

ABSTRACT: All anti-filtration screens constructed at the base of hydro-technical installations allow a certain amount of water to penetrate. The calculation of this permeability of screens is of great importance for the evaluation of the loss of water through filtration and of the counterpressure at the bottom of the installation. The article offers a method of calculation of complete permeable screens (screens built right down to bedrock), based on the fragmentary method of Academician N.N. Pavlovskiy, in which the vertical anti-filtration screen stands out as an independent rectangular fragment at the bottom of the spillway dam. Formulas for the calculation of permeable incomplete (suspended) screens have as yet not existed. The author devotes the rest of the article to the development of formulas, by which the filtration flow can be

TITLE:

Setting up Waterproof Curtains in Sand and Gravel
Grounds

PERIODICAL:

Gidrotekhnicheskoye stroitel'stvo, 1959, Nr 9 pp 4-7
(UUSR)

ABSTRACT:

Under the technical supervision of Engineer N.V. Dmitriyev and the author, the "Gidrospetsstroy" and the "Gidrospetstroy" of the MES USSR carried out experiments on making a waterproof grout curtain in permeable, alluvial ground. The experiments were carried out at two places on the future building site of the earth dam which will form the Churubay-Nurinsky reservoir. The dam will be founded on sand and gravel ground about 40 m deep, whose coefficient of permeability is 296-309 m/24hr. Grouting was carried out under a pressure of 30-60 atmospheres, through seven 5-cm perforated tubes, 6 of them were radially located and one was in the middle, at a distance of

Card 1/2

SOV/98-59-9-2/29

Setting up Waterproof Curtains in Sand and Gravel Grounds

3 m from one to another. The tubes were equipped with jackets and packings, which enable a uniform grouting of each individual layer, starting from the surface of the bottom. The grout was prepared from 17% fine dispersible clay, 3% bentonite, 6% cement and 74% water. Coefficient of permeability decreased after the grouting to 5 m/24hr and the ground was considerably consolidated. There is 1 table.

AUTHOR: Kotval, F., Engineer (Prague)

TITLE: The economical effectiveness of replacing traditional working materials by plastics

PERIODICAL: Plaste und Kautschuk, v. 9, no. 10, 1962, 479 - 485

TEXT: The Commission for the Application of Plastics of the Government Committee for the Promotion of Engineering in the CSSR formed a special board for studying the economical effectiveness of the application of plastics. This board has proposed a method which can be used in all fields of national economy for replacing traditional working materials by plastics. The method consists in determining characteristic figures in three phases: A - production of basic materials in all technological steps, up to the production of a comparable unit of quantity; B - processing of basic materials up to a comparable quantity of semifinished products (e.g. 1000 m pipe, 1 ton of plates); C - application of such products in comparable quantities for equal function (e.g. laying of 100 m pipe in building construction or agriculture). The following technical-economic characteristics are taken into consideration: a) production costs; b) ex-

D029/D109

The economical effectiveness

penditure for work; c) expenditure for energy; d) investments; e) replaceability; f) life-time coefficient. Calculations and comparison are shown in tables. The author gives, as an example, the production of tubes from polymers compared with steel tubes. The application of the method makes it possible to restrict the number of necessary calculations to a minimum. If the general relations are chosen correctly, it is sufficient to calculate in phase A the characteristics for the basic material, in phase B the characteristics for a tube diameter and the given pressure, and in phase C only the corresponding application in the given field of construction. From the derived estimation equation the economical limits can be calculated by algebraic solution. There are 2 figures and 11 tables.

TITLE: On the Problem of Cutting Thick Sections by Low-Pressure Oxygen.
(K voprosu o rezke bol'shikh tolshchim kislorodom nizkogo davleniya).

PERIODICAL: "Svarochnoye Proizvodstvo", 1957, #3, pp 30-31 (USSR)

ABSTRACT: Critical review of the article "Investigation of Cutting thick steel sections by low-pressure oxygen" ("Issledovaniye razdelitel'noy rezki stali bol'shikh tolshchim kislorodom nizkogo davleniya" by S.C. Guzov, and O.Sh. Spektor (1).- "Trudy VNIIAvtogen, ed. III, Goskhimizdat, 1955.

The authors consider erroneous and contradictory the evaluation results given in the criticized work concerning the effect of oxygen pressure, the losses of oxygen depending on the various shapes of nozzle, the pressure existing inside the nozzle, and the way the nozzle shape affects the oxygen stream." It is regrettable that the authors made a considerable effort to study the staged cylindrical nozzles which are known to be of the

least satisfactory nozzle design, but made no use of the correct calculation and production method of smooth nozzles with continuous expansion of bore and impactless stream of gas, and completely ignored the smoothly-narrowing nozzles which have considerably better gas-dynamic flow properties as compared to the simple cylindrical nozzles chosen by the authors as the best".

The article contains 3 references (two of them by the criticized authors, all Russian).
