TITLE: Cast stainless chromium-nickel steel B

SOURCE: Hutnicke listy, no. 7, 1965, 528

TOPIC TAGS: steel, cast steel, stainless steel, chromium nickel steel, stainless chromium nickel steel, cast chromium nickel steel, cast stainless chromium nickel steel

ABSTRACT: This Author Certificate introduces a cast stainless chromium-nickel steel containing 0.12% C, 4.0% Mn, up to 1.5% Si, 18-24% Cr, 15-22% Ni, 2.0-4.0% Mo, 2.5-4.5% Cu, up to 0.1% N, up to 2.0% Co, and up to 0.5% Ti. In presence of 0.2-0.5% V, respective ratios of V:Mo, V:Cu, and V:Ni of 1:8-12, 1:8-16, and 1:43-57 should be maintained, and the Mo content must be at least 5.5%. An increased Cu content makes the steel corrosion resistant in the active state. The steel has 5-40% ferrite, which increases tensile and yield strength and weldability, and eliminates susceptibility to weld cracking. Vanadium refines the cast structure [WW]

TITLE: New economy-alloyed steels

PERIODICAL: Referativnyy zhurnal, Otdel'nyy vypusk. 40. Mashinostroitel'nyye materialy, konstruktsii i raschet detailev mashin, no. 2, 1963, 11, abstract 2.48.76 (Slévárenství, v. 10, no. 5, 1962, 184 - 185) (Czech.)

TEXT: New economy-alloyed cast steels of 18Cr-5Ni-9Mn-N and 18Cr-14Mn+N grades have been developed in CzSSR, as well as 2-phase steels of Cr21Ni5 grade containing no Ni or with the Ni content reduced by 50% compared with austenitic stainless steel of 18/9 grade. Cr-Mn-Ni-N steel is almost with all properties equal to 18/9 steel and has a σ_s higher by 40% at high δ and α_k values, but its corrosion resistance is slightly lower than that of 18/9 steel. Corrosion resistance of Cr-Mn-N steel is equal to that of ferrite steel with 17% Cr, but its mechanical properties and machinability are considerably better. Cr-Mn-N steel has

Card 1/2

New economy-alloyed steels

A052/A126

a σ_{0.2} twice as high as that of 18/9 steel and a δ_{25%} lower. Characteristics of melting and casting of these steels are compared with the technology for 18/9 steel casting and are specified. 2-phase steels of Cr21Ni5 grade can substitute many austenitic stainless Cr-Ni steels; their casting technology does not differ practically from that of 18/9 steel. A stabilizing with Ti or alloying with Mo raises the strength of these steels by 50%, compared with 18/9 steel, but reduces ductility. Cr21Ni5 steels are resisting heat up to 300 - 350°C, their corrosion resistance in many organic and inorganic acids is even higher than that of 18/9 type steel, due to a higher Cr-content, the exception being some aggressive media like 10% HCl. The machinability of 21Cr5Ni steels is better than that of 18/9 steels.

TITLE: Manufacture of silica gel with large pores

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 23, 1962, 473, abstract
23K238 (Czech. pat. 101179, Oct. 15, 1961)

TEXT: SiO_2 hydrogel containing intramicellar liquid (water, aqueous solutions of inorganic and organic substances) is treated in an autoclave under the action of a temperature from 100°C to critical and subject to enough pressure sufficient for preserving the liquid phase in the gel before it is dried. Silica gel is produced with large pores whose size can be controlled by the autoclave treatment conditions. The product is used as a catalyst or a carrier. Example. 27.35 l of a Na_2SiO_3 solution (SiO_2 concentration 113 g/l and density 1.156) is continuously precipitated by adding 35.3 l of 1 N H_2SO_4 , 80 l of silica gel balls are obtained which are left for a certain time in a mother liquor at pH = 10.3 containing

Card 1/2

Manufacture of silica gel...

S/081/62/000/023/061/120
B160/B186

12 g/l of Na_2SO_4 . After draining off the mother liquor the balls are kept for 24 hours in 24 l of 1 N H_2SO_4 and washed in water until there is a negative SO_4^{2-} reaction and the Na_2O content is reduced to < 0.03%. 10 l of the balls are saturated for 3 hours in 4 l of a solution containing 80 ml of NH_4 salt of dibutyl naphthalene sulfonic acid; the liquid is then run off and the granules placed in an autoclave which is heated for 4 hours to 375°C and a pressure of 220 atm. The autoclave is then allowed to cool. The granules which have been treated in this way are dried and roasted in an electric furnace at 600°C. The finished granulated silica gel has a specific surface area of 50 m^2/g , a dry weight of 0.30 kg/l, an absorptive power for water of > 200% and a maximum pore diameter of > 120 Å.

Title : Low Frequency Oscillations of Glow Discharge

Orig Pub : Ceskosl. casop. fys., 1957, 7, No 4, 457-453

Abstract : Damped oscillations were observed in the glow discharge, arising in air at a pressure of 1 mm mercury (and in other gases) and at currents close to threshold value of the self-sustained discharge current. As a rule they can be caused by a sharp change in the discharge current or by a sharp voltage pulse on the external side of the electrode. Unlike the known relaxation oscillations, whose frequency is dependent by the RC constant of the external circuit, the parameters of the damped oscillation depend on the parameters of the discharge plasma.

TITLE: Influence of the Cathode Zone on the Dynamic Properties
of a Glow Discharge in Hydrogen (Vliv katodové oblasti
na dynamické vlastnosti doutnavého výboje ve vodíku)

PERIODICAL: Československý Časopis pro Fysiku, 1958, Nr 5,
pp 526-533 + 1 plate (Czech)

ABSTRACT: To elucidate the influence of the cathode zone on the dynamic properties of a discharge the authors carried out a number of measurements. In the first part of the paper the results are reported; in the second part the authors attempt a qualitative interpretation of the measured relations. The measurements were carried out using the same technique and the same apparatus as was done in measurements reported in earlier work (Ref 2). The discharge tube was connected to a stabilised source of 2.5 kV d.c. which was bridged by a large capacitance; between the cathode of the discharge^{pp} and the grounded negative pole of the source a pentode was connected for the purpose of regulating and stabilising the discharge current. Parallel to the pentode a capacitor of variable capacitance C_x was connected. The results

Card 1/5 /

CZ/37-58-5-3/19

Influence of the Cathode Zone on the Dynamic Properties of a Glow Discharge in Hydrogen

measured for various capacitance values have enabled evaluating the influence of the parasitic capacitance of the cathode end of the discharge relative to ground. Near to the cathode a metal ring was fixed on the external side of the discharge tube to which very short high voltage pulses were fed. Each such pulse brought the discharge into a non-steady state. The establishment of a steady state manifested itself by changes in the intensity of the light emanating from the discharge and changes in the voltage of the cathode of the discharge relative to ground. The characteristics of both these magnitudes was observed on the screen of a pulse-cathode oscilloscope; typical oscillosograms of the cathode voltage recorded by this method are reproduced in Fig.1 (plate p 632b). In Fig.2 the dependence is graphed of the oscillation frequency on the pressure and on the capacitance of the external condenser C_x ($I = 0.20 \text{ mA}$, length of discharge gap 48 cm). In Fig.3 the dependence is graphed of the oscillation frequency on the capacitance C_x for various areas of the cathode surface for a

Card 2/5

CZ/37-58-5-3/19

Influence of the Cathode Zone on the Dynamic Properties of a Glow Discharge in Hydrogen

discharge length of 68.5 cm. In measuring the dynamic properties of the glow discharge in spectrally pure hydrogen it was found that the cathode region does influence the behaviour of the discharge in the unstable state. The results of these measurements are given and also their phenomenological interpretation, which is based on the equivalent circuit of the discharge, Fig.4. The relations derived in the paper permit calculating the magnitudes of all the capacitances and inductances in the equivalent circuit from measured results of the dependence of the oscillation frequency on the capacitance of the external condenser C_x . If the results of measurements of the dependence of the oscillation frequency on the length of the discharge path is known, it is in principle possible to calculate also the magnitude of the inductance L_s and of the capacitance C_s per 1 cm of the length of the positive column. It is practically not possible to measure accurately all these relations over a sufficiently wide range because a change in one of the discharge parameters brings about a change of the frequency and

Card 3/5

Influence of the Cathode Zone on the Dynamic Properties of a Glow
Discharge in Hydrogen

CZ/37-58-5-3/19

damping of the oscillations and the frequency values determined in the case of high damping are very inaccurate. For the time being it is not possible to go beyond determining the order of magnitude of the reactive parameters of the discharge. The results described in the paper show that in the case of a non-steady state glow discharge, the influence of the cathode region on the dynamic properties of the discharge can be appreciable. Thereby, the dynamic properties of the cathode region are of such a type that they are supplementary to similar properties of the positive column and thus form a resonance circuit. Thereby, the possibility is provided of the generation of low frequency oscillations in the discharge even if the external discharge circuit does not contain any reactive elements at all. Acknowledgments are made to Dr. L. Pekárek for his advice and assistance in carrying out this work.

Effect of the cathode region on the dynamic properties of a slow discharge in hydrogen. Václav Kralíček (Czechoslovak Acad. Sci., Prague). Czechoslov. J. Phys. 5, 662-68 (1955) (in Russian).—Short voltage pulses were applied to a glow discharge in spectrographically pure H. These pulses bring the discharge (which is maintained by a d.c.) into a nonstationary state. The return to the stationary state is brought about by a stabilizing process which causes changes in the discharge voltage. It is attempted to formulate a math. expression which describes the oscillographic observations. The formula is in order-of-magnitude agreement with the measurements. A. Kremheller

TITLE: Effect of a hollow cathode on striations in glow discharge

PERIODICAL: Referativnyy zhurnal, Fizika, no. 4, 1962, 32, abstract 4-3-63shch
("Chekhosl. fiz. zh.", 1961, v. B11, no. 9, 682 - 684)

TEXT: The hollow cathode of an experimental discharge tube consisted of two parallel nickel plates. The tube was filled with neon up to 2.7 mm Hg. When a photomultiplier was used, the change of light intensity in time was recorded at different distances between the cathode plates and with constant discharge current. The effect of the hollow cathode, while neither producing intensified striation in the positive column nor acting upon other striation parameters, was found to impair the feedback between the anode and cathode, the magnitude of which in most cases determines the production of self-excited moving striations. TITLE: The physical nature of the production of moving striations in a d-c discharge plasma

PERIODICAL: Referativnyy zhurnal, Fizika, no. 4, 1962, 59 - 60, abstract №Zh406 ("Chekhol. fiz. zh.", 1961, v. B11, no. 10, 729 - 742, English)

TEXT: A mechanism of the lamination of a positive d-c column is suggested and physically interpreted on the basis of a greatly simplified system of equations, whose solution describes the production of a periodic structure of the plasma of a positive column after an aperiodic disturbance. Only three principal physical phenomena, taking place in the plasma of any d-c discharge, were considered: 1) dependence of ionization on the electron temperature, and, consequently, on the electric field; 2) formation of space charges as the result of different ion and electron diffusion rates; 3) production of additional electric fields due to the appearance of space charges. The foregoing processes as a whole give rise to a characteristic circuit, developing in time and space, and,

TITLE: Analogy between a stratified plasma wave and the waves
on the surface of water

PERIODICAL: Československy casopis pro fysiku, no. 5-6, 1962,
546 - 552

TEXT: The process of wave-formation on a smooth water surface
is well known, whereas a similar process of the appearance of
mobile layers, known as "stratification waves", in a gas discharge
is a comparatively unknown phenomenon. Such waves in gas dis-
charges can be produced, for instance, by applying an aperiodic voltage
pulse to an electrode situated in the discharge tube. This
pulse produces an initial stratum which rapidly disappears but
results in the formation of a similar stratum at a certain distance
in the direction of the anode. In turn, after a delay, another
stratum is produced and so on; a set of strata which moves towards
the anode is observed only after several ms, whereas the individual
strata move in the opposite direction. The theory of gravitation
waves on the surface of water can be approximately described by the
Card 1/4 X

Z/037/62/000/005-6/017/049
E192/E382

Analogy between

following basic equations:

$$\frac{\partial^2 \varphi}{\partial x^2} + \frac{\partial^2 \varphi}{\partial y^2} + \frac{\partial^2 \varphi}{\partial z^2} = 0 \quad (1)$$

$$\frac{\partial^2 \varphi}{\partial t^2} + g \frac{\partial \varphi}{\partial z} = 0 \quad (2) \quad \checkmark$$

where φ is the velocity potential, x and y are horizontal coordinates, z is the vertical coordinate, t is time and g is the gravity. The stratification waves in inert gases can similarly be described by a system of partial differential equations

$$\frac{\partial e}{\partial x} = 4 \pi q_0 n_+ \quad (5)$$

$$\frac{\partial n_+}{\partial t} = z' N_0 e \quad (6)$$

Card 2/4

Analogy between

2/037/62/000/005-6/017/049
E192/E382

where e is the local deviation of the electric field from its equilibrium value, n is the deviation of the ion concentration from the equilibrium value N , q_0 is an elementary charge, z' is a constant relating the ionization intensity to the electric-field strength e and x is the distance from the position of the initial perturbation of the equilibrium state. Eqs. (5) and (6) are valid for deviations and take into account the three basic processes in plasma: 1) dependence of the ionization rate on the electron temperature, the temperature being directly proportional to the field; 2) production of space charges by differing electron and ion-diffusion rates and 3) appearance of an additional electric field due to the space charge. The solution of Eqs. (5) and (6) is approximately given by:

$$n_+(x < 0, t) = - J_0 [2a\sqrt{(-xt)}] \approx \\ \approx - \sqrt{\left(\frac{2}{\pi a}\right)} \cdot \frac{1}{t\sqrt{(-xt)}} \cos [a\sqrt{(-xt)} - \pi/4]$$

Card 3/4

Analogy between

Z/037/62/000/005-6/017/049
E192/E382

where $a = \sqrt{(4\pi q \mu N)}$. Comparison of the theory of stratification waves in inert gases with the theory of the gravitation waves on water shows that although the two effects are very similar, the differences between them are primarily due to the different modes of propagation of the perturbations (from the equilibrium state); whereas in waves on water the contact forces are the most important, the electrical phenomena in plasma are such as to act either directly or remotely. In this respect, the moving strata differ from the waves on water and have no direct analogy in mechanical systems. There are 3 figures.

The isolation of further substances from the leaves of Indian hemp (*Cannabis sativa L.*, var. *indica*). Zd. Krejci and František Šantavý (Palackého Univ., Olomouc, Czech.). *Acta Univ. Palackianae Olomucensis* 6, 59-66 (1955) (English summary).—A microbiologically active acidic fraction was isolated from the leaves of Indian hemp. After acetylation with Ac₂O and NaOAc, it gave a microbiologically inactive neutral material which arose from phenolic substances of the ext., and an active acidic fraction (I) which crystd. from Et₂O and was recrystd. from EtOAc-petr. ether, giving a double m.p., 80-100°/127-8°, [α]_D²⁵ -71 ± 4° (c 0.671, CHCl₃), yielded a pink color with H₂SO₄ and a pos. reaction with C(NO₂)₄. Elementary analysis corresponded to C₂₀H₂₄O₄ or C₂₀H₂₄O₆; it contained 2 Ac groups and 2 double bonds which could be hydrogenated with PtO₂ in MeOH. It can be oxidized by perphthalic acid. It was called cannabidiolic acid and was considered to be a carboxy deriv. of cannabidiol, cannabinol, or tetrahydrocannabinol. Infrared spectrum of the diacetetyl deriv. of I is given. Another acidic substance was found in hemp leaves from 1952 and called acid II. It was subjected to sublimation at 100-130°/1 mm. and crystd. from ether and petr. ether, m. 132-4°. Elementary analysis corresponds to C₂₀H₂₄O₄. It is microbiologically inactive. Neutral petr. ether residue was hydrolyzed with alc. hydroxide in N atm. and extd. with Et₂O. The petr. ether eluate from Al₂O₃ column was evapd. and recrystd. from petr. ether giving a paraffin, m. 58°. An alcohol (m. 60-60°) was obtained from the Et₂O eluate. Both were microbiologically inactive. I. M. H.

TITLE: A novelty: Wireless microphone

PERIODICAL: Sdělovací technika, no. 2, 1962, 70

TEXT: The device described is in effect a frequency-modulated miniature transmitter. A detailed circuit diagram of the system is given in Fig. 1. In this, a transistor T_1 operates as an oscillator. The transistor is OC170 and is specially chosen in order to be capable of operating at 100 Mc/s. The transistor operates as a common-base oscillator with the tuned circuit in the collector, the feedback being taken from a tapping on the tuning coil through the capacitor C_1 to the emitter. The oscillator is followed by a high-frequency amplifier stage based on the transistor T_2 , which is coupled to the oscillator by the coil L_2 . The collector of T_2 contains the tuned circuit L_3-C_6 , which is coupled to the antenna. The signal from a

Card 1/3

E192/E382

A novelty

dynamic microphone is amplified by a single-stage audio-amplifier based on T_3 . The amplified audio-signal is applied to the base of T_1 through the coupling condenser C_7 . The low frequency thus changes the operating voltage between the collector and the base of T_1 . This results in the modulation of the collector-base capacitance of T_1 , which is connected in parallel with the tuned circuit. In this way, the oscillator undergoes frequency-modulation. The system is fed from a 13.5 V battery and produces an output of 20 mW in the antenna. The frequency-modulation deviation is 100 kc/s and the bandwidth of the audio-channel extends from 20 c.p.s. to 20 kc/s (at 30 db). The microphone can be used at distances of 50 - 100 m. There are 2 figures.

TITLE: Method of nondestructive inspection for laminations in sheet, plate, and strip. CZ Pat. No. 307-65

SOURCE: Vynalezy, no. 9, 1965, 20

TOPIC TAGS: steel sheet, steel strip, steel plate, inspection, nondestructive inspection, testing, nondestructive testing

ABSTRACT: This patent introduces a method of continuous nondestructive inspection of sheets, plates, and strips for laminations caused by ingot defects such as cavities, blow holes, and nonmetallic inclusions. According to this method, the article inspected is brought to a temperature just above that of the Curie point and any laminations are detected by a difference in magnetic properties as compared to those of sound material.

TITLE: Changes in mechanical properties of cord through the effect
of ionizing radiation

PERIODICAL: Plaste und Kautschuk, v. 8, no. 2, 1961, 66 - 69

TEXT: Plastics and textiles suffer a change through radioactive radiation.
Since automobile tires can now also be vulcanized by means of ionizing
radiation, the authors studied resulting deteriorations of mechanical
properties of tire cord (strength, elasticity). The following cord types
were irradiated in air (from 2 - $2.5 \cdot 10^5$ rep/h) with various doses of γ -
radiation (from ^{60}Co) in the range of from 10^4 to 10^8 rep: terylene cord
(from Great Britain), dederon cord (Eastern Germany), caprone cord,
silon cord, nylon cord (Switzerland), Rudnik viscose cord (Czecho-
slovakia), Cordenka super viscose cord (Netherlands), and cotton cord from
Egyptian cotton. Diagrams show the measured results; the following losses

Card 1/3

Changes in mechanical ...

G/004/61/008/002/002/007
B007/B058

in strength occur at a dose of $3 \cdot 10^7$ rep; polyamide cords 70%, cotton cords 44%, viscose cords 30%, terylene 6%. Cotton- and viscose cords were almost entirely destroyed at doses above 10^8 rep, and a loss in strength of 60% occurred in terylene cord. The decrease in mechanical properties with an increase in the radiation dose proceeded for the individual tire cords as follows: cotton cord: continuous decrease; viscose cord: Rudnik: a similar course, the elasticity decrease amounts to 45% at $3 \cdot 10^7$ rep; Cordenka: after an initially low decrease, the strength- and elasticity drop increases, at $3 \cdot 10^7$ rep, the elasticity drop amounts to 47%; polyamide cords: silon, dederon, caprone, nylon; strength does not change in the range of small doses up to $4 \cdot 10^5$ rep; a steep drop takes place then, but from $2 \cdot 10^7$ rep, the drop becomes small again; terylene cord: strength hardly changes up to a dose of 10^7 rep, and then decreases slowly. A 50% decrease in strength occurs at the following doses: terylene $1.5 \cdot 10^8$ rep, Rudnik $4.7 \cdot 10^7$ rep, Cordenka $3.6 \cdot 10^7$ rep, cotton $2.6 \cdot 10^7$ rep, dederon $1.4 \cdot 10^7$ rep, nylon $1.1 \cdot 10^7$ rep. silon

Changes in mechanical ...

G/004/61/008/002/002/007
B007/B058

10^7 rep, caprone 10^7 rep. A yellow to brown coloring of samples sets in through irradiation. Cords impregnated with rubber solution gave almost the same results. With the aid of published data a report is given on the present state of study of radiation sensitivity of plastics and textiles, and on vulcanization through radioactive radiation, requiring doses of from 1 to $5 \cdot 10^7$ rep. The Czechoslovakian original paper was translated into German by K. Weber, Zentrale Forschungsstelle der Reifenindustrie, Fürstenwalde (Central Research Center of the Tire Industry, Fürstenwalde). There are 8 figures and 23 references: 4 Soviet-bloc and 12 non-Soviet-bloc.

3594. MELTING POINT OF COAL ASH. Hrubek, J. and Krejciik, Z.
(Paliva (Fuel), Prague, 1953, vol. 33, 134-136, 170-176; about. In Chem. N
Abstr., 1955, vol. 49, 703). Russian, German, British, and American (ASTM)
methods for determining melting points are compared. The melting points of
ashes may differ as much as 400° depending on the reductive or oxidative
atmosphere of the furnace. A special Heraeus-type furnace with molybdenum
resistance wire was designed. The ash was subjected to an inert atmosphere
consisting of nitrogen 70, carbon dioxide 10, and illuminating gas 10-12%
to determine the melting point of ash, the ash was treated with 10% dextrin
solution, placed in a special form, and heated. Various samples of ashes
from Czech mines were tested. (L).
