TITLE: Use of Cherepovets Foundry Pig Iron for Malleable Iron Production

PERIODICAL: Liteynoye Proizvodstvo, 1959, Nr 5, pp 40-41 (USSR)

ABSTRACT: In the Ivanovo Plant imeni G.K. Korolev, the period of cooling when tempering malleable iron should be shortened. Cherepovets foundry pig iron type LK2 had to be used. The charge consisted of 20% iron LK2, 37% cracked steel, and 43% recovered stuff. Fig.(1) shows the period of cooling for a standard molten mass of malleable iron and Fig. (2) the same for a new molten mass, for which a shortening of the period of cooling could be obtained. The table shows the chemical composition of the various types of iron as well as their mechanical properties. Fig.(3) shows a diagram of the mechanical properties of thermically treated standard malleable iron with and without Cherepovets iron. There are 3 graphs and 1 table.

TITLE The Tasks to be achieved by the Libraries of the Branches of  
the Academy of Science of the USSR.  
(Sadatschi bibliotetschnoj raboty w filialach akademii nauk  
S.S.R. Russian.)  
PERIODICAL Vestnik Akademii Nauk 1957 Vol 27, Nr 1, pp 115-116  
Received: V/1957 Reviewed: V/1957  
ABSTRACT From the 22 to the 31 October 1956 the forth conference of  
directors of branch libraries and directors of other institutes  
connected with the Academy of Science of the USSR was held at  
Moscow.  
In his opening address, A.I. Gorbanew, doctor of technical  
science and vice president for the coordination of scientific  
work performed by the Academies of the Republics of the Soviet  
Union and their branches in the USSR, outlined the tasks to  
be performed by the Academy of Science of the USSR and  
characterized the part to be played by the various Academies  
and their branches with respect to the planning of scientific  
problems. He pointed out the necessity of improving bibli-  
Graphical work, above all with respect to catalogues. He  
suggested that a wider scope be given to the exchange of books  
and microfilms among libraries and also that the standard  
of education librarians be improved.

CARD 1/3

The Tasks to be achieved by the Libraries of the Branches  
of the Academy of Science of the USSR.  
(Sadatschi bibliotetschnoj raboty w filialach akademii nauk  
S.S.R. Russian.)

The activity of libraries must be on an equal footing with that  
of scientific institutes and must be under the direct super-  
vision of the president of the respective branch library. The  
report delivered by W.I. Abramowa, director of the department  
of special libraries, dealt with the aid to be rendered by  
libraries to their branches in dealing with scientific problems.

The basic stock of books of branch libraries have incre-  
ased by 1/3 in the course of 3 years. It is, however, pointed  
out that in the case of numerous libraries there have not been  
sufficient supplies of new foreign books.

Some libraries in the East, as eg. in Karelia and else-  
where, scientific research institutes and also the biological  
institutes of branch libraries in the Ural have stocks which  
have as yet not been sufficiently well examined. The systematical  
and alphabetical catalogues and book lists of nearly all  
libraries are in sore need of being re-edited. Bibliographical  
work is not satisfactory, and its level is not up to the

standards of scientific institutes. There is lack of co-  
ordination among branch libraries and other institutes of the  
Academy of Science, public libraries and military libraries.

In the course of further discussions an increase of sub-  
ventions for the purchase of new books and a more intense  
utilization of existing stocks, including foreign stocks, was  
demanded.

TITLE: Theory of the Vibration Spectra of Unsaturated Compounds  
(Teoriya kolebatel'nykh spektrov nepredel'nykh soyedineniy)

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1958,  
Vol 22, Nr 9, pp 1023 - 1025 (USSR)

ABSTRACT: On the basis of abundant experimental information on unsaturated compounds the authors tried to generalize the conclusions drawn from it in two directions. The determination of the characteristic frequencies of some structural groups with a double bond and the observation of the mutual influence of the structural elements. To solve these problems, normal oscillations and the constants of the potential energy were computed by means of the theory of the small vibrations of polyatomic molecules (Refs 1-2). Partial results of these computations have been published already before (Ref 3). The basic results of the present paper can be condensed

Card 1/4

Theory of the Vibration Spectra of Unsaturated Compounds SOV/48-22-9-3/40

as follows: The substitution of the hydrogen atoms by alkyl radicals in ethylene leaves the field of the remaining ethylene groups as well as the field of the alkyl radicals almost unchanged. The geometrical distribution of the alkyl radicals with respect to the double bond plays an essential role with regard to the spectrum. The calculations show that in the case of two double bonds that are separated by at least two single bonds the former ones exert almost no influence on each other. On the basis of the computation of the oscillation frequency of cyclopentene the spectrum of the molecule combination dispersion was for the first time interpreted with success. The frequencies and the force constants of some bromine-, chlorine,- and fluorine-substituents of ethylene were computed theoretically. Because of comprehensive data on the spectra of the deuterio-substituted molecules it was possible to carry out an exact computation of the force constants. The good agreement between the computed and the observed frequencies proves the correctness of the whole system of constants. Compared with the halogen

Card 2/4

Theory of the Vibration Spectra of Unsaturated Compounds Sov/48-22-9-3/40

substituents of saturated hydrocarbons the stability of the C-Br-, C-Cl-, and C-F-bonds in unsaturated compounds is somewhat higher. For the first time

$\frac{\partial P_i}{\partial Q_j}$  was computed in the first approximation of the optical valence scheme. On this occasion  $\mu_{CH}$  and  $\mu'_{CH}$  had, as expected, the same values for the oscillations of all types of symmetry. Thus the calculation has shown that the optical valence scheme only in first approximation is applicable to the computation of the intensities in infrared spectra. There are 4 references, 3 of which are Soviet."

TITLE: Vibrational Spectra and Potential Energy Constants of  
Halogenated Ethylenes.<sup>1</sup> Monochloroethylene,  
Monofluoroethylene,<sup>1</sup> 1,1-dichloroethylene,  
1,1-dibromoethylene and their Deuterated Derivatives

PERIODICAL: Optika i spektroskopiya, 1960, Vol.9, No.6, pp 728-733

TEXT: Sverdlov, Klochkovskiy and Kukina (Ref.1) showed that  
the vibrational spectra of halogenated ethylenes can be calculated  
using the force constants of ethylene (Ref.2) and halogenated  
methanes (Ref.3). The present paper extends this work to  
calculation of normal vibrations and potential energy constants of  
monochloroethylene and  $\text{CH}_2=\text{CDCl}$ , 1,1-dichloroethylene,  
1,1-dibromoethylene and  $\text{CBr}_2=\text{CHD}$ ,  $\text{CBr}_2=\text{CD}_2$ , monofluoroethylene  
and its seven deuterated derivatives whose formulae are given in  
the middle of page 728. For the purpose of this calculation the  
authors used the force constants of ethylene and halogenated  
methanes, as well as the force constants of halogenated ethylenes  
reported in the earlier paper (Ref.1). The calculations were

carried out by the method of Yel'yashevich and Stepanov (Ref.3). Natural vibrational coordinates (Figs 1, 2) were used. Tables 1-4 give the calculated frequencies and interpretation of the vibrational spectra of monofluoroethylene and its seven deuterated derivatives (Table 1), of monochloroethylene and  $\text{CH}_2\text{Cl}-\text{CDCl}$  (Table 2), of 1,1-dibromoethylene and its two deuterated derivatives (Table 3), and of 1,1-dichloroethylene (Table 4). The calculated and experimentally observed frequencies agreed quite well. The published interpretations of the vibrational spectra were either confirmed or modified. Parameters of the force fields of the halogenated ethylenes were calculated.

There are 2 figures, 4 tables and 18 references: 4 Soviet, 10 English, 1 German, 1 French, 1 international and 1 Japanese.

TITLE: Modeling of a pattern recognition method using an electronic computer		
SOURCE: AN SSSR, Institut problem peredachi informatsii. Problemy* peredachi informatsii, no. 16, 1964. Teoriya peredachi informatsii (Theory of Information transmission), 48-56		
TOPIC TAGS: electronic digital computer, pattern recognition, character recognition	16	
ABSTRACT: The paper describes an experimental verification of the method of pattern recognition developed earlier by the author (Izvestiya Akad. Nauk SSSR, Otdel Tekhnich. Nauk, Energetika i avtomatika, No. 2, 1962). For modeling the method, the "Strela" electronic digital computer of the Vy*chislitel'nyy tsentr AN SSSR (Computer center of the Academy of sciences SSSR) was used. One thousand projections, collected at random from photographs, were sampled. On the basis of this sampling, all the stages of the recognition process were modeled. The method of calculating the standard deviation of the significant features is described as well as the algorithms used for modeling the recognition process. A comparison of the experimental results obtained

L 25092-65

ACCESSION NR: AT4049773

with the results calculated by theoretical formulas has shown that the latter differ by a factor not exceeding 1.5 and this is considered to be a good agreement for the problem examined. The paper concludes that the described method of modeling the Fayn technique of pattern recognition using a computer has furnished an experimental verification of the validity of the principles of pattern recognition employed in Fayn's method. Orig. art. has: 3 figures, 3 tables, and 24 formulas.

TITLE: Photometric Determination of Uranium by Means of the Reagent Arsenazo

PERIODICAL: Zavodskaya laboratoriya, 1960, Vol. 26, No. 12, pp. 1344-1346

TEXT: Among the well-known reagents to uranium (VI), arsenazo, which, with uranium, gives an intensive yellow complex, is the most sensitive. In the present paper, a rapid method of determining uranium in substances of complex composition is described, which is based upon a single extraction of uranium by means of methylethyl ketone and the photometric recording of the uranium complex with arsenazo. As extracting agents, n-butyl alcohol, ethyl acetate, methylethyl ketone and cyclohexanone, and as desalinating agents, ammonium, magnesium, and calcium nitrates of different concentrations in 0.5 N HNO<sub>3</sub> were investigated. From saturated Ca(NO<sub>3</sub>)<sub>2</sub>- or MgCO<sub>3</sub>-solutions in 0.5 N HNO<sub>3</sub>, uranium is extracted by means of ethyl-acetate, cyclohexanone, and methylethyl ketone with distribution coefficients

Card 1/3

of 170, 230, and 700. The distribution coefficients for Cu, Al, V(IV), and Fe(III) vary between 0.03 and 0.14. When using methylethyl ketone, the concentration coefficient of uranium may be increased to about 23.000, which is further improved by the introduction of complexon III into the solution extracted. Cu, Al, V(IV), Ti, Fe, and Bi do not disturb at a ratio of U:Me of 1:400, 1:500, 1:70, 1:80, 1:600, and 1:500. Uranyl arsenazate decomposes immediately under the action of  $H_2O_2$ , whereas the arsenazates of the other elements, with the exception of vanadium and partly also of thorium, remain unchanged. Titanium does not turn yellow with  $H_2O_2$  at pH ≈ 5. The effect produced by a 30-fold excess of zirconium may be removed by precipitation in form of its phosphate with a pH ≈ 2. Orthophosphoric acid in quantities of up to 3 g/l exerts no essential influence upon the extraction of uranium. During extraction from 0.1-0.2 N  $HNO_3$  in the presence of complexon III, a 200-fold excess of thorium does not disturb. In the case of beryllium excesses of up to 1 ; 200, the sample must be opened up with a mixture of nitric acid and hydrofluoric acid, and must be concentrated by evaporation until it dries. Sulfates, chlorides, phosphates, and fluorides at concentrations of up to

The colorimetric properties of solutions of uranium and titanium dichlorochromotropic complexes were studied at various pH's. The direct separation is based on the fact that at pH 1-2 titanium

I017/I242

Photometric determination.!

forms a characteristic red complex with dichlorochromotropic acid. The selectivity of the dichlorochromotropic acid is based on the difference in pH's for optimal reaction, the ratio of sensitivities between the titanium and the uranium complexing reactions, and the differences in the absorption spectra. In the determination of 0.01-0.1% titanium in uranium the experimental error does not exceed 4%. There are 2 figures and 2 tables. ✓

TITLE: Photometric determination of titanium in the presence of beryllium using 2,7-dichlorochromotropic acid

SOURCE: Zhurnal analiticheskoy khimii, v. 19, no. 5, 1964, 553-555

TOPIC TAGS: titanium analysis, spectrophotometry, titanium, beryllium, chemical analysis, 2,7 dichlorochromotropic acid

ABSTRACT: The described method enables rapid and sufficiently accurate determination of microgram quantities of titanium (IV) in the presence of 10,000 fold or greater amounts of beryllium. The success of this method results from the fact that beryllium forms a weak colorless complex with 2,7-dichlorochromotropic acid and also because the optimum pH values for the reaction of this reagent with beryllium and titanium are different. The alloy samples were dissolved in HCl, heated on a hot plate with 1 ml of concentrated H<sub>2</sub>SO<sub>4</sub> to fumes, the pH was adjusted to 1.0 using quinalidine red and the optical density of the solution was measured upon addition of 5 ml of 1% solution of 2,7-dichlorochromotropic acid. Photometric

Card

measurements were conducted with a green filter (490 millimicrons) using reagent solution for comparison. The values for the concentration of Ti were obtained from the previously prepared calibration graph. The time required for one determination is about 25 - 30 min. In determinations of 10 micrograms of titanium in the presence of 10,000 fold excess of Be, the standard deviation was 5.6 %. Orig. art. has: 1 table and 2 figures.

TITLE: Investigation of the noise spectrum of polycrystalline cadmium sulfide

SOURCE: Tallinn. Politekhnicheskiy institut. Trudy. Seriya A, no. 238, 1966. Sbornik statey po khimii i khimicheskoy tekhnologii (Collection of articles on chemistry and chemical engineering), no. 15, 3-18

TOPIC TAGS: noise spectrum, radio noise, photoelectric effect, photoresistor, photodiode, photoconductor, cadmium sulfide / S-092 photoresistor

ABSTRACT: The noise spectrum of polycrystalline cadmium sulfide photoresistor S-092 was investigated. This work supplements the results of Yu. A. Varvas and P. L. Kukk (Trudy TPI, seriya A, No. 230, str. 109, 1965). A brief literature survey of pertinent papers dealing with the theory of experimental determination of noise in CdS photoresistors is presented, and a schematic of the experimental installation is included. The experimental results are shown graphically (see Fig. 1). It was found that the noise photocurrent in the resistor S-092 may be represented by the expression

$$S_i = \text{const. } U^{\gamma} \Phi^{\beta} f^{-\lambda},$$

TITLE: On the possibility of determining the lifetime of photoelectrons and the quantum yield in polycrystalline cadmium sulfide 7

SOURCE: Tallinn. Politekhnicheskiy institut. Trudy, Seriya A, no. 215, 1964. Sbornik statey po khimii i khimicheskoy tekhnologii (Collection of articles on chemistry and chemical engineering), no. 11, 1964, 237-243

TOPIC TAGS: semiconductor theory, semiconductor material, photoconductor, photoconductivity, cadmium sulfide, cadmium compound

ABSTRACT: Expressions for the lifetimes and the quantum yields of photoelectrons in polycrystalline cadmium sulfide were derived. The investigation is an extension of a previously published work of the authors (Priblizhennyj metod opredeleniya vremeni zhizni neravnovesnykh elektronov v sul'fide kadmiya. Trudy TPI, seriya A, No. 210, 257, 1964). The derivation is based on the model in which the crystal is illuminated by a steady light source of high intensity  $\phi_0$ . Superimposed on this

Card 1/4

UDC: 537.311.33

L 18424-66

ACC NR: AT6003224

light is a high frequency  $\sim 10^5$  cyc/sec light signal having a  $\Pi$ -shape and of much lower intensity,  $\phi_0$ . Under these conditions, the photoconductor is equivalent to the circuit (see Fig. 1).

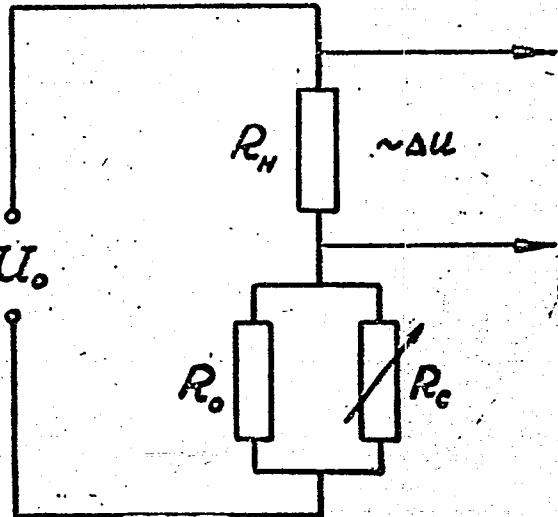

Fig. 1. Equivalent scheme.  $R_H$  - load resistor,  $R_H$  and  $R_c$  - equivalent resistances representing the specimen,  $U_o$  - applied voltage,  $\Delta u$  - signal voltage.

$$\bar{V} = \frac{1}{T} \int_{0}^{T} V_e(t) dt.$$

Card 2/4

L 18424-66

ACC NR: AT6003224

Three expressions for the different relations between  $R_o$  and  $R_H$  are derived in

$$R_u = R_o \quad \tau \approx \frac{TR_o U_o}{16\mu R_{co}};$$

$$R_u \ll R_o \quad \tau \approx \frac{TR_o U_o}{4\mu R_{co}};$$

$$R_u \gg R_o \quad \tau \approx \frac{TU_o R_o^2}{4\lambda\mu R_u R_{co}},$$

where  $\tau$  is the lifetime of the photoelectrons, T is the period of the interrupted light signal, and  $R_{co}$  is the additional resistance of the crystal due to uninterrupted  $\phi_c$ . Expressing  $R_o$  and  $R_{co}$  in terms of the semiconductor parameters

$$R = \rho \frac{d}{S};$$

$$\rho = \frac{1}{n e \mu},$$

where  $\rho$  is the specific resistance of the specimen, d is the interelectrode distance, S is cross-sectional area of the excited layer, n is the concentration of free electrons, e is the electronic charge, and  $\mu$  the electron mobility, the following expression for the quantum yield  $\beta$  is derived as  
Card 3/4

L 18424-66

ACC NR: AT6G03224

$$\beta = \frac{4\lambda u}{TR_n U_e \epsilon \mu \Phi_e}$$

The influence of several effects, e.g., nonlinear recombination, diffusion into deeper crystal layers, and incomplete population of the deeper energy levels of the crystal, on the lifetime and on the quantum yield are discussed in an attached note. Orig. art. has: 1 graph and 24 equations.

B+1

TITLE: The threshold sensitivity of polycrystalline cadmium sulfide

SOURCE: Tallinn. Politekhnicheskiy institut. Trudy, Seriya A, no. 215, 1964.  
Sbornik statey po khimii i khimicheskoy tekhnologii (Collection of articles on  
chemistry and chemical engineering), no. 11, 1964, 245-247

TOPIC TAGS: semiconductor theory, semiconducting material, photoconductor,  
photoconductivity, cadmium sulfide, cadmium compound

ABSTRACT: An expression for the photoconductivity in polycrystalline cadmium sulfide is derived as

$$\Phi_{\text{e min}} \approx \frac{16\sqrt{3}}{\pi} \sqrt{\frac{\phi_0 \tau f}{\rho d t}}$$

The derivation is based on the work of Yu. A. Varvas and P. L. Kukk (Trudy TPI, seriya A, No. 210, 253, 1964), where  $\phi_0$  is the intensity of the steady illumination,  $\phi_{\text{min}}$  is the intensity of the superimposed  $\Pi$ -shaped light signal,  $T$  is the period of the superimposed light impulses,  $\tau$  is the lifetime of the photocurrent, and all

Card 1/2

UDC: 537.311.33 Z

L 18423-66  
ACC NR: AT6003225

the other symbols are taken from the above reference. The expression was tested experimentally by the procedure described by P. L. Kukk and Yu. A. Varvas (O vozmozhnosti opredeleniya vremeni zhizni fotoelektronov i kvantovogo vkhoda v polikristallicheskoy sul'fide kadmiya. Sm. nast. sbornik, str.). It was found that the predicted threshold sensitivity agreed with the measured sensitivity to within 20%. It is concluded that in order to increase the threshold sensitivity one must have  $\beta \approx 1$ , a narrow line, i.e.,  $\Delta f$  small, and a large photosensitive surface. Orig. art. has: 8 equations.

TITLE: An approximation method for determining the lifetime of nonequilibrium electrons in cadmium sulfide

CITED SOURCE: Tr. Tallinsk. politekhn. in-ta, v. A, no. 210, 1964, 257-266

TOPIC TAGS: carrier lifetime, photosensitivity, cadmium sulfide, electron recombination, polycrystal

TRANSLATION: The method is based on excitation of photoconductivity in the specimen by rectangular pulses of light with a period  $T \ll \tau$  ( $\tau$  is the lifetime). Calculation shows that under given conditions in the first approximation the variation in photoconductivity is determined by stationary  $\tau$  and is independent of the nature of the recombination. Expressions are derived for  $\tau$  as a function of the characteristics of the specimen and the parameters of the output voltage pulses from a resistor ( $R_L$ ) connected in series with the sample. Linear and quadratic recombination are

Card 1/2

L 1679-66

ACCESSION NR: AR5014414

considered and it is shown that at  $R_1 \ll \bar{R}$  ( $\bar{R}$  is the average resistance of the specimen in time  $T$ ),  $\tau$  is independent of the type of recombination, while at  $R_1 = \bar{R}$  the corresponding expressions for  $\tau$  differ in the numerical coefficient. The method is used for measuring  $\tau$  in polycrystalline samples of CdS with Cu and Cl impurities. Values of  $\tau$  range from  $1.1 \cdot 10^{-2}$  to  $3 \cdot 10^{-3}$  seconds. As was expected, a reduction was observed in  $\tau$  with an increase in the intensity of illumination. A. Zhdan.

TITLE: Calculation determination of several parameters of Hall detectors

B

SOURCE: Ref. zh. Metrologiya i izmeritel'naya tekhnika, Abs. 9.32.790

REF SOURCE: Tr. Tallinsk. politekhn. in-ta, v. A, no. 213, 1964, 13-26

TOPIC TAGS: Hall generator, conformal mapping, geometric form

ABSTRACT: The relation between generalized geometric parameters of Hall detectors of various configurations and the input transfer resistances is determined. The problem is solved by the conformal mapping method. Specific calculations for disk and rectangular detectors are produced. It is shown that increasing the Hall angle decreases the effect of the geometry on the electrical characteristics of the detector. Only two generalized geometric quantities are sufficient to find the basic relations. The problem remains to find the relation between actual parameters of the detector. Bibliography of 9 citations. TITLE: Effect of the characteristics of the technological process on the properties of heat-resistant metal castings

SOURCE: Soveshchaniye po teorii i tehnicheskikh protsessov. 8th, 1962. Mekhanicheskiye svoystva litogo metalla (Mechanical properties of cast metal). Trudy soveshchaniya. Moscow, Izd-vo AN SSSR, 1963, 223-228

TOPIC TAGS: refractory metal, heat resistant alloy, alloy casting, molybdenum alloy, tungsten alloy, carbon containing alloy, titanium alloy, cast metal property

ABSTRACT: The lack of industrial flow processes for manufacturing heat-resistant metals has led to insufficient knowledge of the properties of these castings. The authors investigated the influence of the methods of melting, casting parameters and other features on the properties of alloy castings containing titanium and molybdenum. The metals were cast in a DVP-15 vacuum electric oven with an electric arc in a carbon crucible. Parts are currently made of molybdenum by plastic bending of castings obtained by electric arc fusion of special packs of molybdenum and crystallization in water-cooled copper molds. Melting of molybdenum with a tungsten electrode and casting in centrifugal copper molds ensures the highest quality of dense molybdenum castings with fine structure. Orig. art. has: 6 figures and 3 tables.

TITLE: The effect of gases on the quality of titanium alloy castings

SOURCE: AN SSSR. Komissiya po tekhnologii mashinostroyeniya. Gazy v litom metalle (Gases in cast metals). Moscow, Izd-vo Nauka, 1964, 150-153

TOPIC TAGS: cast titanium, titanium alloy casting, blowhole formation, gas saturation, titanium porosity, oxygen adsorption, nitrogen adsorption, hydrogen adsorption, mold material, mold temperature

ABSTRACT: The authors note that the principal requirement in the production of titanium castings is to safeguard the metal against contamination, particularly oxygen, hydrogen and nitrogen. This requirement predetermines the basic specification of the entire technological process of the production of titanium alloy castings. In the mold materials only the most chemically inert materials may be used: silicon dioxide, electrocorundum and magnesite. The lining of crucible must contain a minimum amount of those components which react actively with titanium. The metal is melted in a vacuum in a cooled crucible with a lining of the same alloy as that which is being melted. Particularly attention was paid in this article to: 1) the effect of the mold materials and the mold temperature during teeming on

the gas content and the mechanical properties of the metal of the castings; 2) the effect of the metal of the consumed electrode and of other factors on the development of blowholes in thin-walled titanium castings. The effect of the mold materials was studied on the basis of castings prepared by the melted model method, with the gas content in the castings determined by the vacuum-smelting method. The basic titanium contained 0.0150% oxygen. The mold material of lowest quality, from the point of view of minimal oxygen contamination of the metal, was found to be zirconium dioxide and melted magnesite. The higher the temperature at the metal - mold boundary, the more intensive the interaction, the increase in the oxygen content in the casting metal as the temperature of molds of different refractory materials was increased being extremely significant. The authors give 150 - 250°C as the optimal mold temperature. The distribution of gases throughout the section of the casting was investigated by measuring the microhardness, with the discovery that the surface layers of the casting showed the highest degree of contamination. A study was made of the effect of different technological factors on the susceptibility of the casting to the development of blowholes by means of casting disks of varying thickness, with the disks so obtained checked for the presence of blowholes by X-ray. Thin-walled castings were found to be especially vulnerable to this type of gas-originated surface flaw. This statement is developed in detail in the article. A comparison of disks obtained from metal smelted in a vacuum at  $1 \cdot 10^{-1}$  and at  $1 \cdot 10^{-3}$  mm Hg or from metal which had undergone special

vacuum degassing indicated that the basic charge has a considerable effect on the formation of blowholes in the castings: with degassed metal, the quantity of blowholes decreases noticeably. In disks without blowholes, defects in the form of shrinkage porosity are observed, while this type of defect is absent when blowholes are present. The authors also state that the number of blowholes in the casting depends on the configuration of the casting and the method employed in

The effect of a gaseous medium during melting and refining of chromium

SOURCE: AN SSSR. Komissiya po tekhnologii mashinostroyeniya. Gazy\* v litvom metalle  
(Gases in cast Metals). Moscow, Izd-vo Nauka, 1964, 167-171

TOPIC TAGS: cast chromium, gas saturation, chromium melting, chromium refining,  
oxygen adsorption, hydrogen adsorption, rare gases, zirconium, rare earth admixture

ABSTRACT: After noting that the principle cause of chromium brittleness is gaseous impurities, the authors discuss the results of studies on the influence of various factors on the physical and chemical conditions for the smelting of chromium, from the point of view of ensuring a minimum gas content in the cast metal. The metal was smelted in an OKB-493m high-vacuum furnace in a refractory crucible of zirconium dioxide. As the basic material, un-

0.002-0.050% N<sub>2</sub>. The experimental melts were made in an inert argon atmosphere, since due to the high chromium vapor pressure at the melting temperature (63.5 mm Hg). It is not possible to melt the metal in a vacuum. For the purpose of decomposing the nitrides and removing the adsorbed gases, the chromium was aged at 750, 1200 and 1400°C for 30 minutes at each temperature, and also in the melted state. The chromium was poured

in order to exclude any effect of the mold material on the gas content.

Further details regarding the technique will be given below.

Conditions which ensure the absence of coronal discharge in the vacuum at high temperatures were also determined during the development of specific smelting conditions.

In the melting 5 kg of chromium lasted up to 10 minutes. The effect of the temperature on the content of oxygen and nitrogen in the cast chromium as a function of temperature and duration of exposure. Oxygen content was found to increase somewhat, in comparison with the base content, together with the time of aging. The nitrogen content decreased with aging for 30 minutes at 750-1200°C. Experiments showed that the optimal aging regime is 1200°C and 30 minutes. In the cast metal the hydrogen content stood at

0.002-0.050% and the nitrogen content 0.002-0.050%.

Mixtures of the oxide type, e.g. approximately 10% Cr<sub>2</sub>O<sub>3</sub> + 90% Cr, were melted as after the first (0.66%). For the purpose of studying the effect of the mold on the gas-saturation of the chromium, samples were prepared in

O  
molds of different refractory materials, and a table is given in the article illustrating the dependence of the oxygen content in the castings on the mold material used. The authors indicate that the microhardness of the chromium is not changed by the mold material. The use of rare-earth elements to enhance the mechanical properties of cast chromium is discussed in some detail. Data are presented which indicate that the content of non-metallic inclusions in cast chromium without admixtures reaches 0.661%, while an analysis of the non-metallic inclusions showed the presence of oxides of the Cr<sub>2</sub>O<sub>3</sub> type and oxides of the rare-earth elements. In this way, the rare-earth elements are found to have a refining effect. The article concludes with a brief discussion of a special study which was made to determine the optimal argon pressure for high-quality stock. The authors show that the structure of chromium, melted and teemed at an argon pressure of 600 mm Hg, is finer than that of chromium poured at 300, 60-10, and 1.2 mm. According to some writers, a fine-grain structure reduces the temperature threshold of chromium brittleness. Orig. art. has: 3 figures and 3 tables.

PACHONSKA J. Univ. in Cracow. Wplyw iperytu azotowego na ustepowanie porazen w.  
gruzliczym zapaleniu opon moszowo-rdzeniowych leczonych streptomycyna the influence  
of nitrogen mustard on the regression of paralysis in cerebrospinal meningitis  
treated withstreptomycin Polsk. Tfg. Lek. 1949, 4/40 ( 131-1182)

A decrease of paralysis in TB spondylitis, observed a few hours after the administration of nitrogen mustard, encouraged the authors to investigate its influence on other paralytic states especially in the course of TB. There gression of paralysis in 6 children treated in Clinic for Children's Diseases in Warsaw. This chemical compound was also found to cure paralysis of the peripheral nerves in meningitis of some week's standing, but it does not prevent the development of paralysis. Nitrogen mustard was use intravenously in doses of 0.01 g. per kg. body weight daily, repeating doses every 24 hours from 2-3 times. The therapeutic results are perhaps due to the resorptive and anti-inflammatory action of the chemical, or to irritant action on the nervous tissue. The latter hypothesis is confirmed by observations of certain effects on paralysis of various origin (peripheral neuritis, radiculitis, crania nerve palsy, also in spastic constrictures is rheumatoid arthritis) and by some evidence of relief in cases with the clinical symptoms of optic nerve atrophy (observed in the optahmotigical clinic of Jagiel University). It may be that in the phenomena described there is a chain of reactions, one link of which is the specific action of the nervous system and through it, diminution of the clinical symptoms of inflammation.
