Raschet tonnel'nykh obdelok (Calculation of Tunnel Linings)
Moscow, Transzheldorizdat, 1960. 344 p. 3,000 copies printed.

Ed.: P. M. Zelevich, Engineer; Tech. Ed.: Ye. N. Bobrova; Ed.
(title page): M. I. Dandurov, Professor, Corresponding Member,
Academy of Construction and Architecture USSR.

PURPOSE: This book is intended for students in transportation and
other departments of Soviet schools of higher education.

COVERAGE: The book presents problems in the calculation of tunnel
linings for ensuring economical construction. The authors dis-
cuss loads acting on the tunnel lining, calculation of concrete
linings by methods developed by S. S. Davydov and Metrogiprotrans
(State Subway Design, Planning, and Research Institute), and con-
struction and calculation methods for block lining. Detailed

Card 1/8

Calculation (Cont.)

SOV/4903

examples for the calculation of different types of linings are given. Ch. I (except Secs. 4 and 8) and Sec. 17 of Ch. III were written by Docent M. M. Arkhangel'skiy. Chs. II, III, (except Sec. 17), and IV and Secs. 4 and 8 of Ch. I were written by A. S. Kuris'ko. Ch. V was written by Candidate of Technical Sciences D. I. Dzhincharadze. The following personalities are mentioned as having contributed to this field: O. Ye. Bugayeva, whose design method is included in the book, G. G. Zurabov, Academician B. G. Galerkin, Professor S. S. Davydov, and S. A. Orlov, Candidate of Technical Sciences. There are no references.

AUTHORS: Kurits, A. A., Simson, A. E.

TITLE: How to Increase the Power of Compression-ignition Engines (Puti povysheniya moshchnosti dvigateley s vosplameneniyem ot szhatiya)

PERIODICAL: V sb.: Povysheniye moshchnosti dvigateley s vosplameneniyem ot szhatiya. Moscow, Mashgiz, 1954, pp 123-142

ABSTRACT: The authors examine the limits of the rational use of various schemes of low-pressure turbosupercharging for compression-ignition engines in which the thermal stress and the maximum combustion pressure are nearly constant. The investigation is conducted for an exhaust-gas turbosupercharger system in which the backpressure in the exhaust pipe ahead of the turbine is either variable or constant. Utilizing a parabolic variation of the pressure of the gas in the exhaust manifold, corresponding to a linear variation of the flow velocity, the authors derive approximate equations for the determination of the effectiveness of the turbosupercharger. Formulas are also obtained for the mean indicator and effective pressures. The analysis of the results of various schemes of turbosupercharging in four- and two-stroke

Card 1/2

SOV/124-58-1-503

How to Increase the Power of Compression-ignition Engines

engines reveals that the low range of turbosupercharging (up to 2 kg/cm²) does not require any structural changes in modern engines and yet can accomplish a worthwhile increase over their unsupercharged power, namely, by about 100% in four-stroke engines and about 40% in two-stroke engines.

Candidates of Technical Sciences

Teplovoznyye dvigateli i gazovyye turbiny (Diesel and Gas-turbine Locomotive
Engines) Moscow, Transzheldorizdat, 1957. 463 p. 10,000 copies printed.

Ed.: Girshberg, N. M., Candidate of Technical Sciences; Tech. Ed.: Bobrova, Ye. N.

PURPOSE: This book is approved by the USSR Ministry of Higher Education as a text-
book for institutes of railroad transportation. It may also be useful to
engineers specializing in internal combustion engines, and gas turbines.

COVERAGE: The book deals with basic theory and design in the construction of the
modern diesel and gas-turbine locomotives. The following subjects are
discussed: working processes and cycles, engine dynamics, principle of work,
economy and performance characteristics, automation of control systems,
engine output control, locomotive operation, and safety. In addition to these
topics the author also gives a brief history of the development and uses

Card 1/12

Diesel and Gas-turbine (Cont.)

323

of internal combustion engines and gas turbines. The author claims that gas-turbine engines require less time to develop full power capacity than steam turbine engines. He also claims that aircraft gas turbines are able to develop full power capacity within 1.5 to 2 minutes, and that gas turbines in the aircraft industry are fully understood and are widely used on many types of aircraft. According to the author, the 1956 statistics show that Soviet gas turbine engines, not considering those used in aircraft, are able to develop power of about one million hp. A special chapter is devoted to discussion of free-piston gasifiers and prospects for their development and use. The author states that the Voroshilov Diesel Engine Locomotive Plant has developed a free piston-and-turbine compound locomotive engine with a capacity of 6,000 hp. and an efficiency of 29.4 percent. The book contains numerous tables, graphs, diagrams and detail drawings of various types of Soviet and foreign internal combustion engines and gas turbines. There are 84 references of which 82 are Soviet and 2 English.

TITLE: Increasing the economy of type D50 diesels

SOURCE: Moscow. Vses. n.-i. inst. zh.-d. transporta. Vestnik, no. 6,
1964, 25-27

TOPIC TAGS: industrial equipment, diesel engine, turbocompressor/D50
diesel, TK-30 turbocompressor

Abstract: Measures are listed which may be taken to increase the efficiency
of the D50 diesel. Carrying out these measures will increase the efficiency
of supercharging, and also improve gas distribution and carburation by re-
ducing the specific effective fuel consumption by 20 grams per effective
horsepower hour. This will place D50 diesels (with respect to economy)
among modern locomotive diesels. The necessary structural changes in the
Card 1/2

2

piston bottom, distributor shaft exhaust cams, fuel pump delivery valve and cam, injector nozzle, and also in the installation of type TK-30 turbo-compressors may be carried out both on newly produced diesels and on those in operation without impairing the interchangeability of mass produced units and components. The use of high temperature cooling, raising the efficiency of supercharging and several other measures make it possible to count on the potential for a further increase in the efficiency of the D50 diesel. A saving of 8-10% in fuel in a locomotive with 1000 hp represents an economy of 80-100 tons of fuel per year per locomotive, so that the money spent in modernization of the locomotive fleet will be paid back in less than a year. There will be no increase in the cost of diesel production in carrying out these measures. Orig. art. has: 1 figure and 2 graphs.

Bacilli.

Only Pub : Zh. mikrobiol., epidemiol. i imunobiologii, 1958, (1951)
prirodenie, 9

Abstract : The standard glanders antigen produced a positive RSK
(blood serum reaction) with 4 of 14 sera against blue
pyogenic bacilli. Three sera from glanders-infected
horses agglutinated a number of strains of blue pyogenic
bacilli in dilutions of 1:25-1:100 and formalinized cul-
tures in dilutions of 1:200-1:400. A normal horse serum
did not agglutinate these strains. These results, in
the authors' opinion, verify the relationship between the

Abstract: Description of photographic camera for photographing an interference pattern and a procedure for adjusting the mirror-lens apochromatic [text in error] asymmetrical objective of the camera. Methods of manufacturing asymmetrical lenses are described and certain investigation results obtained with a camera are given. The optical characteristics of the objectives are: $F = 500$ mm, 1:6.3; field $2\beta \approx 40^\circ$. The visually-observed resolving power of the objectives over the entire field is approximately equal to the rated one (230 lines/mm), and is approximately 200 lines/mm at the center of the field. The minimum resolvable

TITLE: Conference on improving the techniques and technology of production at the Works of Glavelektroapparat of the Ministry of Electro-technical Industry. (Soveshchaniye po sovershenstvovaniyu tekhniki i tekhnologii na zavodakh glavelektroapparata MEP)

PERIODICAL: "Vestnik Elektropromyshlennosti" (Journal of the Electrical Industry) 1957, Vol. 28, No. 5, pp. 78 - 80 (U.S.S.R.)

ABSTRACT: This article is a report on a conference held in December, 1956. It consists of a brief account of each of a series of reports dealing with procedures that have been adopted to improve production methods in a large number of factories. The products covered are capacitors, general electrical equipment, welding equipment. Particular processes considered include a new method of friction welding, press tool design, manufacture of plastic parts and others.
No figures, no literature references.

TITLE: Experimental industrial unit for the continuous teeming of steel

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 2, 1962, 47, abstract 2V282
("Sb. tr. Ukr. n.-i. in-t metallov", 1961, no. 7, 143-150)

TEXT: The authors describe an experimental industrial continuous steel-teeming unit constructed at the Ukrainian Institute of Metals. The design of this unit provides for the casting of round and square blanks, 60 - 200 mm in diameter. On the teeming platform located at 11.5 m height from the shop floor, there are: an assembled water-cooled Cu-crystallizer with a mechanism for its reciprocal displacement, and an intermediate teeming device without a stopper and with a metering zirconium nozzle of 14 - 19 mm in diameter. Directly underneath the crystallizer on a 3 m long section there are the secondary cooling sprayer unit and the guide rolls. To pull the blanks an electric-driven drawing stand is used, which makes it possible to regulate the speed of drawing the blanks within a wide range. The roll pressure on the blank may also vary from 1.0 to ✓

5.0 tons by adjusting the springs. Below the drawing stand there is the gas-cutting cabin, which moves during the blank cutting process along vertical guides at 3.2 m pace. The cut-off blank pieces drop into the collecting device pocket where they are accumulated. The metal intended to be teemed on the unit is cast in a 1.0-ton electric furnace and is supplied to the unit in a ladle without a stopper. The ladle is lifted to the unit with the aid of a telpher line. The unit is controlled from a desk located on the teeming platform; the gas cutter and the collecting device are controlled from a second desk located in the gas cutting cabin. The unit is equipped with a control-measuring mechanism. There is a templet shop near the unit.

TITLE: An experimental industrial profile-bending machine of the Ukrainian
Institute of Metals

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 12, 1961, 10, abstract 12D63
("Sb. tr. Ukr. n.-i. in-t metallov", 1961, no. 7, 178-195)

TEXT: A technology was developed for the production of bent profiles and
an experimental industrial profile-bending machine was designed for the shaping
of up to 8 mm thick and up to 300 - 400 mm wide sheet metal. The type of the
idle-stand mill is continuous > 10 with guiding rolls. The rated shaping speed
is 18 - 20 m/min. A schematic diagram of the mill is presented and its compo-
nents are described in detail. The strength of working rolls and stage of the
roughing stands are calculated. The power of the mill motor is determined. In
1959 the manufacture of some bent profiles was tested on this mill.

TITLE: Continuous bronze casting on the horizontal YNIIM (UNIIM) machine

PERIODICAL: Byulleten' tekhniko-ekonomicheskoy informatsii, no 10, 1961, 11-12

TEXT. Since the methods of producing blanks from bronze and brass, cast in chills and on vacuum suction installations yield an insufficient output of serviceable castings (75-80%) and are of low efficiency, the Ukrainskiy institut metallov (Ukrainian Institute of Metals) in cooperation with the Khar'kovskiy zavod tsvetnykh metallov (Khar'kov Non-Ferrous Metal Plant) has developed an entirely new technology and designed the horizontal UNIIM machine for the continuous casting of bronze, yielding an output of serviceable blanks of 98-99%. The new technological process is characterized by the following: a graphite crystallizer heated on one end and cooled on the other is connected to the metal container and to the chamber of secondary cooling, this assembly being set into reciprocating motions by a special mechanism. The reciprocating motion prevents the blanks being cast from disrupting. To cool the blanks being cast down to 120-150°C the water flow

Card 1/2

Continuous bronze casting ...

S/193/61/000/010/002/008

in the channels should not be less than 1.25 m/sec. The best material for the contact walls of the crystallizer, having a length of 180 mm, is soft electric graphite. The water consumption of the crystallizer cooling section is 2 - 3 liter/min. On the pilot horizontal UNIIM casting machine round cast blanks 55 mm in diameter and up to 3.3 m long are produced from Br СЦС -555 (Br OTsS-555) bronze. Surface, macrostructure, chemical nonhomogeneity and mechanical properties of the bronze blanks meet the requirements of ГОСТ(GOST) 613-50. The semi-industrial horizontal casting machine under construction at the Khar'kovskiy zavod alumininiyevykh i bronzovykh splavov (Khar'kov Aluminum and Bronze Alloy Plant) will produce blanks 25 - 150 mm in diameter from Br OTsS-555 and Br OTsS-663 bronze. Depending on the blank diameter, the machine has a capacity of 1.24-4.6, 4.6-18.6 and up to 41.8 tons/day producing blanks of 25 - 50, 50 - 100 and 100 - 150 mm in diameter respectively. The machine overall dimensions (length x width x height) are 9.5 x 1.2 x 1.3 m; it weighs 11.2 tons. There is 1 figure.

TITLE: Continuous casting of bronze on the horizontal УНИИМ
(UNIIM) machine

PERIODICAL: Tsvetnyye metally, no.3, 1962, 67-74

TEXT: Production of bronze and brass billets by casting in a mould by normal means has the disadvantages of low production rates and inability to produce billets less than 60 mm in diameter or more than 1000 mm in length. Vertical continuous casting seemed unfavourable for bronze and brass with small cross sectional areas and therefore experiments were carried out on a horizontal continuous casting machine developed by the Ukrainskiy institut metallov (Ukrainian Metals Institute) and the Khar'kovskiy zavod alyuminevykh i bronzovykh splavov (Khar'kov Aluminium and Bronze Alloys Works). The method used is based on a graphite crystallization mould, induction heated at one end and cooled at the other, connected with a metal-reservoir and a chamber for secondary cooling. The whole is capable of reciprocating motion.

Card 1/2

Continuous casting of bronze ...

S/136/62/000/003/005/008
E021/E435

Liquid metal is fed from the metal-reservoir through the heated part of the crystallization mould into the cooled part where solidification of the metal takes place with continuous extraction of the billet by a pulling device. The main technical parameters for continuous casting of tin bronze in a round billet were worked out. The quality of the metal completely complies with specifications. A semi-industrial horizontal machine for casting round billets of 25 to 100 mm diameter has been constructed in the Khar'kov Aluminium and Bronze Alloys Works. This enables an increase in annual production of up to 98% and completely mechanizes production. Continuous casting of brass, copper and other non-ferrous metals can be carried out on a horizontal machine. There are 5 figures and 2 tables.

AUTHOR: An Editorial note on p 18 is followed by contributions to the discussion by a number of authors.

TITLE: Discussion on the Design of Medium and Low Output Industrial Power Stations
(Diskussiya po voprosu proyektirovaniya promyshlennyykh elektrostantsiy
sredney i maloy moshchnosti)

PERIODICAL: Promyshlennaya Energetika, 1958, Nr 6, pp 18-33 (USSR)

ABSTRACT: Editorial note p 18

The unsatisfactory position in the equipment, design and construction of small and medium industrial power stations is seriously retarding power development. In Promyshlennaya Energetika, 1956, Nr 9, M. I. Levrov published an article for discussion on this subject. We must agree with Lavrov that the standard designs issued by Promenergoprojekt are unsatisfactory and new types of industrial Heat and Electric power stations are required. Small, costly, inefficient power stations are displacing small and medium heat and electric power stations simply because these latter are too big and complicated. Small and medium power stations should be cheap and simple and their design should be thoroughly reviewed. Industrial gas turbines should be introduced. In the discussion published below there are no contributions from Works making power equipment and they and staff of Councils of National Economy are asked to join in.

94-58-6-12/19
Discussion on the Design of Medium and Low Output Industrial Power Stations

be used for power stations of 8 - 12 MW. Unit feed lines are desirable, but there should be automatic connection of spare feed pumps. Fuel handling equipment can be simplified. The standards of the Boiler Inspectorate should be simplified.

Kuritsyn, F. F. pp 23-29

It is most important to estimate industrial loads correctly or the station will be underloaded, alternative forms of power and heat supply should be fully considered. Existing constructional standards are in urgent need of revision and are retarding the work of design organisations. Not enough attention is paid to the demands of the final customer. In Light Industry during the 5th Five Year Plan not a single project put up by TEP and Promenergoprojekt for power stations passed without important changes of output or construction and in some cases they were rejected outright. A number of industrial power stations started up in the last few years are only running on half load.
