200 kg/mm²: The VKS-1 is a comparatively low-alloy steel which contains only 0.02% V and 0.002 Mo and acquires a high strength with tempering below the temper brittleness range. For steels of this group, the use of electrical heating has definite advantages. Steels of the second group contain 1—2% Mo and less than 0.5% V and require tempering at about 500C. Electrical heat treatment of a typical steel of this group, 40Kh5SM1F (Vascolut 1000) steel containing 0.4% C and 1.2% Mo, sharply increased its embrittlement in the temper brittleness range and produced a strength 10—15 kg/mm² lower than conventional heat treatment. structural transformation of austenite free from grain boundaries. This is a phenomenon of metallography, which is studied in an attempt to determine the nature of the transformation. When a tempered iron alloy containing 8% Cr and 0.2% C is heated at the rate of 2500-10000°/sec, the austenite grain is broken up after completion of the $\alpha \rightarrow \gamma$ transformation. This phenomenon is studied in an attempt to determine the nature of the transformation.

The rate of transformation is a function of the rate of heating. The orientation of the austenite needles is enough to cause the process of transformation. The question of phase boundaries is also a function of the rate of heating.

Title : The Effect of the Bee Venom Preparation in the Complex Therapy of Patients with Hypertension and Atherosclerosis.

Orig Pub : Kazansk. med. zh., 1957, No 1, 48-53.

Abstract : Preparation KF (bee venom diluted in peach oil to a concentration of 1:2000-1:2500) was used in 66 patients with hypertension, mostly of stage 2 and on 16 patients with atherosclerosis. The preparation was injected subcutaneously in doses of 0.5-1 ml. daily or every other day. The course of treatment consisted of 15-30 injections. As a result of the treatment, headaches disappeared, sleep improved and good spirits appeared. A significant decrease was noticed in the arterial blood pressure in the

Kamnev, P.V., Candidate of Technical Sciences, Docent, Ed.

Peredovoy opyt kovki (Advanced Experience in Forging) [Leningrad] Lenizdat, 1959. 246 p. 5,000 copies printed.

Ed.: Ye.V. Yemel'yanova; Tech. Ed.: I.M. Tikhonova.

PURPOSE: This collection of articles is intended for workers and engineers in die-forging shops and for personnel of affiliated branches in the machine industry.

COVERAGE: The articles deal with the advanced experience of a number of Leningrad plants in mechanizing and improving production methods in die forging. Recommendations are made concerning the specialization of forging shops, and the further development of open-die forging processes. Articles by operators-innovators in forging shops of the Novo-Kramatorskiy (New Kramatorsk) and Ural'skiy (Ural) machinery plants are included. The collection contains some of the papers which were discussed during the conference in June 1958 (P.V. Kamnev, Chairman) on open-die forging, called by the regional section for the pressworking of metals of the Leningradskoye Pravleniye nauchno-tekhnikeskogo obshchestva mashinostroitel'noy promyshlennosti (Leningrad)

TITLE: Outer Van Allen belt and bursts of x-rays in the stratosphere

SOURCE: Vsesoyuznaya konferentsiya po fizike kosmicheskogo prostranstva. Moscow, 1965. Issledovaniya kosmicheskogo prostranstva (Space research); trudy konferentsii. Moscow, Izd-vo Nauka, 1965, 454-460

TOPIC TAGS: radiation belt, x ray, stratosphere, magnetic storm, solar activity, Van Allen belt

ABSTRACT: Observations of bursts of x-rays in the stratosphere, which are apparently the result of bremsstrahlung of high-energy electrons trapped in the magnetic field of the earth, are discussed. The work and results from a number of American and Soviet groups are described. The results of observations made during 1964 above Murmansk and Mirnyy are presented, giving the integrated photon energy spectra and the dependence of count rate on pressure for the four events described. By comparison with the previous results, it was found that increased radiation in

Card 1/2

L 2321-66

ACCESSION NR: AT5023618

the stratosphere is correlated with recurrent magnetic storms, with large ionospheric disturbances, and, in the aurora zone, with the absorption of radio waves in the F2 layer of the ionosphere. Toward the minimum of solar activity the frequency of x-ray bursts remained unchanged, and the photon energy spectrum became more stable. Satellite measurements made at the same time showed no increase in galactic cosmic ray intensity.^{9m} Since the number of high-energy electrons in the outer Van Allen belt is insufficient to explain the intensity of x-rays in the stratosphere, it is concluded that the x-rays must be caused, in part, by an additional flux of electrons produced by transient electron-accelerating processes occurring in the magnetosphere of the earth. Suum."

Belgrade, Veterinarski Glasnik, Vol 17, No 6, 1963, pp
507-510.

Abstract: /Authors' English summary modified/ The authors
conclude on the basis of their investigations of 2500 in-
fected hogs that the disease known as Vulvovaginitis suum
is a subacute and chronic alimentary intoxication caused
by fungal infection from grains (corn, barley). The dis-
ease can be brought about within 10 days with test feedings
of infected feed. The signs of the disease disappear when
the use of infected feed stops.

Title : Quantum Theory of Conductivity

Orig Pub : Bull. scient. Conseil Acad. RPFY, 1957, 3, No 3, 75

Abstract : A new method is proposed for formulating a theory of electric conductivity. In the first part of the work the author describes the basic features of the method and performs calculations of general character. In the second part the results obtained are used to calculate the electric conductivity of metals with cubic lattice in the strong-coupling approximation. Many properties are found as a consequence of the crystalline structure of the metals. It is seen from the results how important it is to know the energy states and particularly the energy levels of the electrons in the metals.

[Climatic requirements of the appearance and propagation of mildew of the grape and experiments on its prevention introduced in 1952.] Vojvodina, Hidrometeorološka Stacija, Voznik, 2(2, 3):53-57; 85-90, April/June; July, Sept. 1953. 3 figs., table. DWB - General characteristics of mildew caused by *Plasmopara viticola* are described and illustrated. Requirements of its activation are determined as follows: 1) temperature above 12°C (optimum 23°), 2) rain for at least 2 days with at least 10 mm rainfall, 3) the existence of vine leaves at least 2/3 cm in size. A curve of average incubation time as a function of season is presented (according to MILLER). A research program conducted in Yugoslavia and comprising observation of the disease in experimental vineyards in conjunction with weather development is announced and preliminary qualitative results are reported for the period May-July 1952. 527. PROSPECTIVE DEVELOPMENT OF THE ANTITUBERCULOUS SERVICE IN THE SERBIAN REPUBLIC - O perspektivnom razvoju antituberkulozne službe u nr Srbiji - Ljubisavljevic S. - TUBERKULOZA 1958 (84-98) Graphs 2 Tables 3 illus. 4

The author stresses the need to secure all the necessary conditions if the problem of tuberculosis in Serbia is to be successfully solved. These conditions are: improvement of the work in the existing dispensaries and opening of the new ones, introduction of new diagnostic methods, increase of the beds, treatment and rehabilitation of the tuberculous patients, carrying out of the mass antituberculous campaigns as a constant method of the work of all antituberculous institutions and making use of all the other branches of the health service. The above-mentioned suggestions call for considerable financial resources and other materials as well. That seems very difficult but regarding what has been done and achieved in Serbia under worse conditions when the economic situation was much more unfavourable than it is today, they look with hope to the future especially because all proposals do not surpass what was done before.
