2578. Adrenaline and histamine reciprocal regulation. L. Csaly,  
G. Horváth, and G. Ludány *Acta Physiol. Acad. Sci. Hung.*, 1955, 8,  
109—118 (Pathophysiol. Inst., Med. Univ., Budapest, Hungary). — Med. 3  
Histamine determinations with guinea pig gut and blood pressure of  
atropinised cats in the blood of dogs under chloralose and evipan  
anaesthesia showed that stimulation of the left splanchnic nerve  
causes a rise in the histamine content. It may attain a level  
several times higher than the original. It reaches its max. in 2—5  
min. and returns to normal in 10 min. The histamine content of  
the blood does not change during the sinus caroticus pressor reflex.  
6 µg./kg./min. adrenaline was found to be the min. causing a rise  
in blood histamine. Noradrenaline also raises blood histamine.  
The adrenaline-histamine reciprocity is considered to be a physio-  
logical mechanism because it appears on strong sympathetic  
stimulation. (German) A. B. L. BERNÁK.

MD ✓ 3899. Action of cortisone and adrenocorticotrophic hormone on intestinal absorption of glucose. J. Gyökössi, P. Kertai, and G. Ludány *Arch. int. pharmacodyn.*, 1955, 101, 228-233 (Patho-physiological Inst., Medical Univ., Budapest).—Deoxycorticosterone (1 mg. for 5 days) does not restore the diminished glucose absorption in the adrenalectomized rat. Cortisone (1.5-2.5 mg. for 5 days) is only partly effective. Both hormones combined bring the absorption back to normal or even higher values. In normal animals, higher doses of cortisone reduce glucose absorption; small doses of ACTH do not affect it and larger doses increase its rate. Cortisone and DCA together provide the necessary phosphatase activity and electrolyte milieu for normal glucose absorption. (German). V. D. Eiszen.

1808. LUDANY G., VAJDA J. and HITNER E. Pathophysiol. Inst., med. Univ.,  
Budapest. \*Die Wirkung der sympathischen Erregung auf den Komplement-  
gehalt des Blutserums. The effect of sympathetic stimulation  
on the complement content of blood serum Z. IMMUNFORSCH.  
1955, 112/3 (275-283) Tables 8

A transitory complement increase, lasting less than 2 hr. is produced in human  
serum by subcutaneous injection of adrenaline. In experimental animals the same  
effect is brought about by intravenous injection of DL-noradrenaline, by the pressor

1808 CONT

reflex of the carotid sinus and by stimulation of the central fibres of the sciatic nerve. The stimulation causes a complement increase in the adrenal veins, and the increase is prevented by clamping the adrenal veins. Adrenalin causes complement to increase even with the adrenals excluded from the circulation. Thus production of protective substances is under the influence of the sympathetic nerves.

1720. LUDÁNY G., VAJDA G. and HITNER I. Orvostud. Egyetem Kóréletani Int., Budapest. \*Szimpatikus izgalom hatása a vérsavó komplement tartalmára. Effect of sympathetic stimulation on the serum complement KISÉRL. ORVOSTUD. 1956, 8/2 (134-140) Tables 8  
Adrenaline administered s.c. causes a reversible increase of serum complement by 25% in human subjects. The effect wears off in 2 hr. In dogs under barbiturate or chloralose anaesthesia a similar effect is given by DL-noradrenaline i.v. The carotid sinus pressor reflex and the effects of stimulation of the central sciatic stump after section of the depressor fibres cause an increase of complement in dogs. During splanchnic stimulation the venous blood from the adrenals has a higher complement titre. Electrical stimulation of the splanchnic nerve after ligation of the adrenal veins does not alter the serum complement. Parenterally administered adrenaline still raises the peripheral serum complement level after adrenalectomy. These experiments give further confirmation of the hypothesis that the 'protective substances' of the organism are favoured by the sympathetic system. (II, 4\*)

Blood Pressure.  
Orig. Pub. : Magyar tud. akad. biol. és orv. tud. oszt. közl., 1957,  
8, No. 1-2, 150--153  
Abstract : The depressor nerves were transected in 15 dogs  
under chloral hydrate anesthesia, and then the common  
carotid artery was compressed every 60 seconds; this  
procedure produced a rise in blood pressure to 80--120  
mm Hg. Hyperthermy was produced by covering the animals  
with rubber cushions through which hot water circulated.  
During the induction of hyperthermy to body temperatures  
up to 41° and during the subsequent period of cooling,  
full reflex autoregulation of blood pressure was observed.  
At temperatures of 41 to 42° autoregulation remained  
adequate during hyperthermy, but was disrupted to a  
significant degree during the cooling period. At body

The euglobulin fraction 'necrosin', prepared from pleural exudate of dogs as proposed by Menkin, which exerts a tissue-damaging action, was studied with regard to its effect on the phagocytosis of *Staph. pyogenes aureus* by dog and rat leucocytes. Even low concentrations of 'necrosin' (1:800) caused a distinct decrease of the phagocytary action of the leucocytes. The fraction prepared in a similar manner from serum, on the other hand, showed only a slight inhibitory action.

TITLE: Effect of lowering of the pH in the duodenum on hepatic blood flow

SOURCE: Kiserletes orvostudomány, v. 17, no. 3, 1965, 317-321

TOPIC TAGS: dog, drug effect, pharmacology, digestive system, liver,  
hydrochloric acid, blood pressure, blood circulation

ABSTRACT: In dogs under chloralose anesthesia, it was determined by means of Hensel's heat-conduction catheter that the hepatic blood flow increases by a mean value of 21 per cent upon the injection of 2.5-3.0 ml/kg of an 0.35 per cent HCl solution into the duodenum. The effect disappears in 5-16 minutes during which period there is a slight but definite drop in blood pressure. The renal blood flow remains unchanged. The intraduodenal administration of physiological saline solution produces no similar effect. The mechanism and clinical aspects of the phenomenon are referred to briefly. The authors thank Gyula Szilassy, Varga Lajos,

"The Effect of Omentectomy on Erythrophagocytosis."

Budapest, Orvosi Hetilap, Vol 107, No 12, 20 Mar 66, pages 537-538.

Abstract: [Authors' Hungarian summary] Omentectomy performed on rats results in a considerable decrease in the immuno-erythrophagocytosis of leukocytes. According to the findings, the omentum is also connected with the function of the mobile cellular protective installations of the organism. The experimental data are confirmed by statistical calculations. 2 Hungarian, 18 Western references.

TITLE: The Catalogue of Positions of 70 Variable Stars

PERIODICAL: "Peremennyye zvezdy", 1960, Vol. 12, No. 5, pp. 328-336 (English  
summary)

TEXT: Observations of variables (mainly cepheids) were performed by the  
author in 1953 - 1955 by means of the meridian circle of the Odessa Observatory  
(D = 13.5 cm, F = 148 cm); the system of fundamental stars from the Astronomical  
Yearbook of the USSR (system FK3) was employed. Altogether 2,948 observations of  
 $\delta$  and 1,772 of  $\delta$  were performed at two positions of the circle (E and W). The  
number of observations of fundamental stars amounts to 50 - 80% of the total number  
of observations during one night. On an average, each star was observed 8 times.  
The course of magnitudes  $u+m$  and equator points in time was found graphically  
during the processing. The system of the instrument was determined from the ob-

The Catalogue of Positions of 70 Variable Stars

servations of the fundamental stars, however corrections for the system were not introduced in the catalogue, since they were of an obviously random nature; the same pertains to differences of type W-E. The average positions of the stars were given in the present catalogue for the equinox 1950.0 and for the epoch of observations. The root-mean-square error of one observation turned out to be equal to  $\pm 0^s.025 \cos \delta$  for  $\Delta$  and  $\pm 0".38$  for  $\mu$ .

TITLE: A statistical method of operational control in the production of tubes. (Statisticheskii metod operatsionnogo kontrolya v proizvodstve trub).

PERIODICAL: "Stal'" (Steel), 1957, No.6, pp.543-547 (USSR).

ABSTRACT: The use of a statistical method of the control of wall thickness of tubes is discussed. Two factors were taken into consideration: mean wall thickness and difference in thickness of two opposite walls. The use of control charts is demonstrated. The control limits calculated from a statistical formula based on theoretical characteristics of normal distribution (Refs.1 and 2) were found to be inapplicable, therefore these were taken on the basis of correlation of mean wall thickness with the distribution of differences in the wall thickness. On checking the accuracy of the method chosen during rolling tubes of various dimensions, it was found possible to calculate the control limit for the difference in the wall thickness on transferring from one wall dimension to another from a formula:

$$(\Delta k)_x = (\Delta k)_d \frac{(S \text{ mean})_x}{(S \text{ mean})_d}$$

Card 1/2

A statistical method of operational control in the  
production of tubes. (Cont.) 133-6-19/33

where:  $(\Delta k)_4$  - the position of the control limit of the  
wall difference at a nominal wall thickness 4.0 mm;  
 $(S \text{ mean})_4$  - mean wall thickness at a nominal wall thick-  
ness of 4.0 mm (according to tolerances ГOCT-301);  
 $(S \text{ mean})_x$  - mean wall thickness mm, at a nominal wall  
thickness  $x$  for which the control limit is being calcu-  
lated;  $(\Delta k)_x$  - the control limit of the wall difference  
for the new wall thickness. There are 3 tables, 3 figures  
and 2 references, both Slavic.

Ed.: A.P. Cherkasov; Ed. of Publishing House: R.A. Belina; Tech.  
Ed.: S.P. Andreyev.

PURPOSE: This collection of articles is intended for technical  
and scientific personnel in metallurgy and in mechanical engineer-  
ing. It will also be of interest to designers of rolling equip-  
ment.

COVERAGE: This collection of articles treats the theory of rolling.  
It discusses such factors as the total and the unit pressures  
of the work on rolls, moment of rolling, forward slip, spread,  
etc. It also includes results obtained from investigation of  
rail quality; properties of cast iron sheets, and other problems.  
No personalities are mentioned. References follow each article.

Cherkasov, A.P., and M.I. Chupakov (Candidate of Technical Sciences).  
Deformation of Metal in the Manufacturing of Pipe (layer) 173  
The authors present a method for determination of local (layer)  
deformations for any section of pipe in the focus of deforma-  
tion, at which the measuring processes (rolling, drawing,  
rotary rolling) in order to determine the most suitable process  
for given conditions.

TITLE: Anodic-mechanical grinding of carbide tube-drawing dies

SOURCE: Metallurgicheskaya i gornorudnaya promyshlennost', no. 6, 1966, 31-33

TOPIC TAGS: metal cutting machine tool, electrospark machining, grinding machine, abrasive, die, metal tube, МЕТАЛ ДРАВЛЮГ

ABSTRACT: In order to extend the life of tube drawing dies used at the Lenin works for drawing tubes up to 50-70 m/min, the ordinary alloy steels used for making the dies were replaced by the hard alloys VK-8, VK-10, and VK-15. Three anodic-mechanical methods were used to machine and polish the dies: anodic-mechanical, using an erosion process which removed large amounts of material but roughened the surface; electroabrasion, using an electrochemical process for cleaning the surface; and abrasion, using the working fluid without electric current. A schematic drawing (see Figure 1) of the technique showed the work (+) and tool (-) kept in contact with sodium silicate solution having a specific gravity of 1.23. The operation

UDC: 621.789.1 : 669.27

Card 1/2

ACC NR: AP7002747

of the anodic-mechanical grinding machine is described and technical data for all three processes are given. The lapping material, turning angle, electric parameters, surface characteristics, and grinding time are listed for each process. One anodic-mechanical machine was able to handle all of the die machining during normal cold drawing operations at the Lenin works. Industrial trials have shown that the hard alloy dies last for more than 6000 pieces of tube. Orig. art. has: 2 figures, 1 table.

Title : Calculations Involved in the Design of Rotary Kilns.

Orig Pub : Cement. Wapno. Gips, 1958, 14, No 3, 49-54

Abstract : Two basic design methods are being used in the design of cement rotary kilns: the empirical and the scaling up (from small units). The former one is based on the direct measurement of volume, or of the internal kiln surface, i.e., values that determine its capacity. The latter method is based on the similarity of processes taking place in rotary kilns and the geometrical scaling up of a model dimensions to those of a commercial size using straight dimensional ratios. Experience has demonstrated that it is feasible to create identical conditions of heat transfer, of gas velocities, etc. in pilot plant models as those encountered or expected to prevail in

ORIG. PUB. : Cement-Wapno-Gips, 15, No 1, 11-18 (1959)

ABSTRACT : The author discusses the various types of coolers used for the cooling of the clinker produced in rotary kilns. Special attention is devoted to modern grate-type coolers (GC) which appear most economical and efficient. Data obtained from comparison tests show that whereas the heat losses in revolving coolers (RC) on the average attain a value of 50-125 kcal/kg clinker, they do not exceed 30-60 kcal in GC. The final clinker temperature is 113-160° for GC with a secondary [sic]

AUTHOR: Lłodert, Karol, (Łódź)

TITLE: Simplified formulae determining the coefficient of radiant heat absorption

PERIODICAL: Archiwum Budowy Maszyn, v. 8, no. 1, 1961, 61 - 72

TEXT: In a number of technical problems concerned with heat exchange knowledge of the coefficient of radiant heat absorption is necessary, either in the form of a given value  $a_r$  in a given temperature, or in the form of temperature function. Determination of the  $a_r$  value is simple; however, the complicated form of  $a_r = f(t)$  dependence presents difficulty in mathematical operations. In this case the mean value of  $a_r$ , for a certain range of temperature, is used with the result that great errors are made. In this article the author discusses present methods determining the coefficient of radiant heat absorption and presents simplified formulae determining the  $a_r = f(t)$  dependence, which in a sufficient way enable us to solve a number of heat absorption problems without complicated calculations. In conclusion the author points out that in performing accurate thermal calculations it is not allowed to use the mean value of the  $a_r$  coefficient, espe-

TITLE: Temperature changes during periodic heating

PERIODICAL: Archiwum budowy maszyn. v.8, no.2, 1961, 223-238

TEXT: This work gives a mathematical theory of heating an insulated body with a periodic supply of power. By means of the formula given it is possible to determine: 1) Temperature  $t$  of the body at any time during its periodic heating; 2) Mean temperature of the body during its  $n$ -th heating or cooling period and for the steady state periodic heating; 3) Minimum and maximum temperatures of the body during its  $n$ -th heating period or at the steady state conditions; 4) Time after which the maximum temperature will differ from that in the steady state by a given percentage value; 5) Initial time of heating required to bring the body to its steady state in the first heating period. An insulated body (Fig.1) of mass  $G$  with a specific heat  $c$  placed in the ambient of temperature  $t_0$ , is considered. It is assumed that the body is heated ( and cooled) uniformly, there is no accumulation of heat in the insu-

3 - heater.

constant and

$$k = \frac{1}{\frac{\delta}{\lambda} a + \frac{1}{\alpha}}, \quad \text{where} \quad (A)$$

Card 2/12

P/032/61/008/002/002/002  
D217/D306

$\alpha$  - outer surface film coefficient

$a = S/S_i$

$\delta$  - thickness of insulation

$S$  - outer area of insulation

$S_i$  - equivalent (geometric mean) area.

If the body is heated from temperature  $t_p$  with a heater power  $P$ , then after time  $\tau$  we have:

$$t = A \left( 1 - e^{-\frac{\tau}{T}} \right) - (t_p - t_0) e^{-\frac{\tau}{T}} + t_0 \quad \text{where } \quad (2)$$

$$P/kS = A = \text{const}, \quad Gc/kS = T = \text{const}, \quad (B)$$

At  $\tau = \infty$  the steady temperature  $B$  is reached whatever the value of  $t_p$ . Similarly for cooling from temperature  $T_M$  we have,

$$t = (t_M - t_0) e^{-\frac{\tau}{T}} + t_0. \quad (5)$$

Temperature changes...

When the body (Fig. 1) is heated periodically ( $\tau_1$  heating,  $\tau_2$  cooling time) its temperature will never attain the maximum value B for the continuous heating, but some lower value M (Fig. 4)

Fig. 4

The function  $f(\tau)$  for periodic heating is given in two parts,

$$f(\tau) = \begin{cases} f_n(\tau) & \text{dla } (n-1)(\tau_1 + \tau_2) < \tau < (n-1)(\tau_1 + \tau_2) + \tau_1, \\ g_n(\tau) & \text{dla } (n-1)(\tau_1 + \tau_2) + \tau_1 < \tau < n(\tau_1 + \tau_2), \end{cases} \quad (6)$$

where  $n = 1, 2, 3, \dots$

Functions  $f_n(\tau)$  and  $g_n(\tau)$  are sums of geometric progressions with the factor  $e^{-\frac{\tau}{T}}$  and  $e^{-\frac{\tau_1 + \tau_2}{T}} < 1$ . Their final form is

$$\begin{aligned} f_n(\tau) &= t_0 + A \left( 1 - e^{-\frac{\tau - (n-1)(\tau_1 + \tau_2)}{T}} \right) + \\ &+ A \left( 1 - e^{-\frac{\tau_1}{T}} \right) \frac{1 - e^{-\frac{(n-1)(\tau_1 + \tau_2)}{T}}}{1 - e^{-\frac{\tau_1 + \tau_2}{T}}} e^{-\frac{\tau + \tau_2 - (n-1)(\tau_1 + \tau_2)}{T}}, \\ g_n(\tau) &= t_0 + A \left( 1 - e^{-\frac{\tau_1}{T}} \right) \frac{1 - e^{-\frac{n(\tau_1 + \tau_2)}{T}}}{1 - e^{-\frac{\tau_1 + \tau_2}{T}}} e^{-\frac{\tau + \tau_2 - n(\tau_1 + \tau_2)}{T}} \end{aligned} \quad (9)$$

Temperature changes...

The mean temperatures  $\bar{t}_{sn}$  during n-th heating or  $t_{sn}$  during n-th cooling period are given by

$$\bar{t}_{sn} = \frac{1}{\tau_1} \int_{(n-1)(\tau_1+\tau_2)}^{n(\tau_1+\tau_2)-\tau_1} f(\tau) d\tau = \quad (10)$$

$$= t_0 + A + \frac{AT}{\tau_1} \left(1 - e^{-\frac{\tau_1}{T}}\right) \left[ \left(1 - e^{-\frac{\tau_1}{T}}\right) \frac{1 - e^{-\frac{(n-1)(\tau_1+\tau_2)}{T}}}{1 - e^{-\frac{\tau_1+\tau_2}{T}}} - 1 \right]$$

and  $t_{sn} = \frac{1}{\tau_2} \int_{n(\tau_1+\tau_2)-\tau_2}^{n(\tau_1+\tau_2)} f(\tau) d\tau = \quad (11)$

$$= t_0 + \frac{AT}{\tau_2} \left(1 - e^{-\frac{\tau_2}{T}}\right) \left(1 - e^{-\frac{\tau_2}{T}}\right) \frac{1 - e^{-\frac{n(\tau_1+\tau_2)}{T}}}{1 - e^{-\frac{\tau_1+\tau_2}{T}}}$$

Card 6/1 2

Temperature changes...

P/032/61/008/002/002/002  
D217/D306

The mean temperature  $t_{sn}$  for the whole n-th period is:

$$t_{sn} = \frac{\bar{t}_{sn} \tau_1 + t_{sn} \tau_2}{\tau_1 + \tau_2}, \quad (12)$$

$$t_{sn} = t_0 +$$

$$+ \frac{A\tau_1 + AT \left(1 - e^{-\frac{\tau_1}{T}}\right) \left[ \left(1 - e^{-\frac{\tau_1}{T}}\right) \frac{1 - e^{-\frac{(n-1)(\tau_1 + \tau_2)}{T}}}{1 - e^{-\frac{\tau_1 + \tau_2}{T}}} + \left(1 - e^{-\frac{\tau_2}{T}}\right) \frac{1 - e^{-\frac{n(\tau_1 + \tau_2)}{T}}}{1 - e^{-\frac{\tau_1 + \tau_2}{T}}}\right]}{1 - e^{-\frac{\tau_1 + \tau_2}{T}}}$$

Temperature changes...

The limits of these mean temperatures, corresponding to the steady state periodic heating, are determined. To find the temperature maxima and minima at steady state heating it is not necessary to know function  $f(\tau)$ . Under steady conditions  $\Delta t_n$  is equal to  $\Delta t_n$  (Fig. 6) and we have

$$\Delta t_{\max} = \lim_{n \rightarrow \infty} \overline{\Delta t_n} = \lim_{n \rightarrow \infty} \Delta t_n = M - n = \frac{2A \sinh \frac{\tau_1}{2T} \sinh \frac{\tau_2}{2T}}{\sinh \frac{\tau_1 + \tau_2}{2T}} \quad (23)$$

Fig. 6

Card 8/ 12

Temperature changes...

P/032/61/008/002/002/002  
D217/D306

To find the time at which maximum temperature  $M_n$  will differ from the steady state maximum by less than  $p\%$ , the following inequality is solved:

$$\frac{M - M_n}{M - t_0} 100 < p\% \quad (24)$$

This gives

$$\tau > T \ln \frac{100}{p} \quad (25)$$

and

$$n > \frac{T}{\tau_1 + \tau_2} \ln \frac{100}{p} \quad (26)$$

Temperature changes...

It is often an advantage to bring the heated body into the steady state conditions in the first heating period. This is achieved by lengthening the first heating period by time  $\tau_w$  which is obtained by putting

$$A \left( 1 - e^{-\frac{\tau_w}{\tau}} \right) + t_0 = m,$$

to give

$$\tau_w = T \ln \frac{A}{A - m + t_0} \quad (27)$$

Card 10/12

Temperature changes...

P/032/61/008/002/002/002  
D217/D306

The change of temperature  $t = \varphi (\tau)$  during the steady state  
[Abstractor's note: Measuring time from the end of the initial  
heating period  $\tau_w$ ] is given by

$$\varphi(\tau) = \begin{cases} A \left( 1 - e^{-\frac{\tau - (n-1)(\tau_1 + \tau_2)}{T}} \right) + \frac{A \left( 1 - e^{-\frac{\tau_1}{T}} \right)}{1 - e^{-\frac{\tau_1 + \tau_2}{T}}} e^{-\frac{\tau + \tau_2 - (n-1)(\tau_1 + \tau_2)}{T}} + t_0 & \text{dla } (n-1)(\tau_1 + \tau_2) < \tau < (n-1)(\tau_1 + \tau_2) + \tau_1, \\ \frac{A \left( 1 - e^{-\frac{\tau_1}{T}} \right)}{1 - e^{-\frac{\tau_1 + \tau_2}{T}}} e^{-\frac{\tau + \tau_2 - n(\tau_1 + \tau_2)}{T}} + t_0 & \text{dla } n(\tau_1 + \tau_2) - \tau_1 < \tau < n(\tau_1 + \tau_2). \end{cases} \quad (28)$$

The method is given of deriving M and m directly without the need

Card 11/12

Temperature changes...

P/032/61/008/002/002/002

to obtain function  $f(\tau)$  and the series for Mn and mn. Periodic heating is peculiar to many industrial installations (cumulative heaters, intermittently working furnaces, engines, etc.) to which the derived formulas can be applied. Calculations are accurate if the actual conditions approach the assumptions on which the formulae were obtained. This is especially true in the case of intermittently working motors, transformers, compressors, etc. The authors terminate the article with an example of calculations for a domestic cumulative heater. There are 7 figures and 5 references: 1 Soviet-bloc and 4 non-Soviet-bloc.
