AUTHOR: Lyatifova, L. A.; Sakharova, M. M.

TITLE: Catalysis over an organic semiconductor based on polyacrylonitrile

SOURCE: AN AzerbSSR. Doklady*, v. 20, no. 1, 1964, 31-33

TOPIC TAGS: catalysis, organic semiconductor, polyacrylonitrile, polymeric carbon, pyrolyzed polyacrylonitrile, pyrolyzed polymer, semiconducting polymer, formic acid decomposition, isopropyl alcohol, decomposition

ABSTRACT: A study has been made of the catalytic activity of an organic semiconductor, designated PAN-3 — heat-treated polyacrylonitrile with 0.14% Ni as the nitrate added prior to heat treatment. This research was performed at the Institut khimicheskoy fiziki AN SSSR (Institute of Chemical Physics, AN SSSR). The electrical conductivity of PAN-3 at room temperature was $5 \times 10^{-7} \text{ ohm}^{-1} \text{ cm}^{-1}$; the specific surface, $1.3 \text{ m}^2/\text{g}$. Catalytic decomposition of formic acid

Card 1/2

ACCESSION NR: AP4030348

or isopropyl alcohol over PAN-3 heat treated at 300 and 400°C, respectively, was studied. In the case of formic acid, marked catalytic activity was exhibited. However, both in catalytic activity and in selectivity with respect to formic acid dehydrogenation, PAN-3 was somewhat inferior to metal-free or copper-containing polyacrylonitrile semiconductors. The apparent activation energy of decomposition of formic acid determined from a plot of log(decomposition rate) versus reciprocal temperature was 15.2--15.8 kcal/mol. In the case of isopropyl alcohol, PAN-3 showed no marked catalytic activity in the 287--381°C range. However, no definite conclusions as to the catalytic activity of PAN-3 in isopropyl alcohol decomposition could be drawn, because partial decomposition of polyacrylonitrile took place during its heat treatment at 400°C. The authors thank S. Z. Roginskiy, Corresponding Member, AN SSSR, and B. B. Krentsel', Doctor of Chemical Sciences, in whose laboratories this work was carried out. ABSTRACT: A scientific session that dealt with clinical and experimental problems pertaining to radiation therapy was held on 1-3 Jun 1964 at the Central Scientific Research Roentgeno-Radiological Institute of the Ministry of Health USSR at Leningrad. Among the reports presented, one by A. S. Morozov contained data indicating that combined treatment of Pliss lymphosarcomas of rats with sarcolysin and local irradiation was more effective than chemotherapy or radiation treatment alone. The same conclusion was arrived at by Ye. I. Orlova with respect to treatment of experimental lymphosarcomas of rats with ribonuclease and by applying local X-ray irradiation. The biological effects of bremsstrahlung of 25 mev were discussed by V. I. Gordon. Prof. L. V. Funstejn and E. I. Shcherban' found that Fe accumulated in various tissues and organs in amounts depending on the radiation dose applied in the treatment of malignant tumors.⁷² The

luminescence of the blood also changed in a regular manner with the dose of radiation. It was proposed that data on the accumulation of Fe and the luminescence of the blood be used in evaluating the effectiveness of radiation therapy. According to a report by G. Ye. Reznik, inhalation of O₂ alleviated some harmful effects produced by radiation in connection with the radiation therapy of lung cancer. Several reports were presented on the autotransplantation of bone marrow from a bone shielded during irradiation. This method was applied both experimentally and in clinical work and found effective in the prophylaxis and therapy of radiation injuries to the blood-forming system. L. A. Mel'nikov, A. V. Kantin, and A. I. Starshinin reported on application of Au¹⁹⁸ in the treatment of cancers of the breast and of the tongue. A considerable amount of time at the session was devoted to problems of clinical dosimetry. Dosimetry in connection with the application of solutions containing Au¹⁹⁸ and P³² was discussed. A. A. Gabelov and L. M. Stukova presented a report on some clinical dosimetry prerequisites for the use of a linear accelerator in the treatment of cancer of the cervix. After the scientific session a colloquium on physical fundamentals of clinical dosimetry was held on 3-6 Jun 1964. [JPRG] 6

TITLE: Pulsation of the force of hydrodynamic pressure on the boundary of a turbulent flow

CITED SOURCE: Tr. Vses. proyektno-izy*skat. i n.-i. in-ts Gidroproyekt, sb. 10,
1963, 69-85

TOPIC TAGS: hydrodynamics, turbulent flow, flow boundary, hydrodynamic pressure pulsation, planar flow

TRANSLATION: The author presents a solution of the problem of determining the statistical parameters of the force of hydrodynamic pressure acting on an element of the planar rigid boundary of a turbulent flow. The solution is found according to the known parameters of the pressure pulsation at individual points on the surface of the element. As the basic characteristic of the stationary random process under consideration, the correlation function of the hydrodynamic pressure force was selected. Relations were determined for this function, including general relations as well as relations for

Card 1/2

L 16884-65
ACCESSION NR: AR4045233

particular cases of uniform and locally uniform turbulence under the conditions of a plane problem, when the pressure at various points of the cross section of the flow pulsates synchronously, but with different amplitudes. It is demonstrated that under planar flow conditions many practical problems can be solved, with acceptable accuracy, by the approximate relations, obtained for the uniform or locally uniform turbulent flow. An estimation is made of the accuracy of the derived relations and solutions. The author also studied the problem of the application of the pressure force correlation function, under the conditions of a spatial problem, to uniform and non-uniform turbulent flows, as well as the problem of the pulsation of the moment of force of hydrodynamic pressure, with the correlation function of the pressure force moment selected as the basic characteristic of this pulsation. TITLE: A Conference on the Method of Teaching Physics (Konferentsiya po metodike fiziki)

PERIODICAL: Fizika v Shkole, 1957, # 6, page 93 (USSR)

ABSTRACT: A scientific conference on the method of teaching physics took place at the Moskva Oblast' Pedagogical Institute with teachers from the city of Moscow and the Moscow Oblast' and representatives of the Moscow, Stalingrad, Krasnodar Mariyskiy [in Yoshkar-Ola], Kabardino-Balkarskiy, Tula, Yaroslavl', Berdichev, and Shuya pedagogical institutes, the Institut of Psychology APN and the Kaluga Oblast' Institute for the Improvement of Teachers.

The following reports were heard and discussed: S.I. Ivanov - "The Methods of Methodical Researches", O.N. Lapina - "The Rise and Development of Concepts of Temperature and Quantity of Heat". (at the 7-class school), Ye.Kh. Lyatker - "The Rise and Development (at the pre-school age and the 7-class school) of Basic Concepts in the Field of Electricity", T. Ya. Ishkova - "The Rise and Development (during the pre-school age and at the 7-class school) of Concepts of Magnetism", A.V. Selenginskiy - "On the Development of

Concepts in the Field of Mechanics and Heat", L.I. Tigranova - "The Psychological Peculiarities of Pupils in Learning the Basic Concepts of Physics", A.N. Kaygorodov - "Conveying to the Students Skill in Making Measurements Before They Take up Studies in Physics", S.F. Shilova - "The Home Work of the Pupils in Physics, Difficulties and Mistakes in Carrying It Out", G.P. Kondrasheva - "Individual Observations Made on Two Pupils Doing Their Home Work in Physics", N. Ye. Parfent'yeva - "The Performance of Home Work in Physics by Pupils of a 7-class Boarding School".

The conference adopted resolutions on continuing and co-ordinating the scientific-research work into the method of teaching physics, on the question of forming physical concepts and obtaining skill, and also on the method of organizing home work. The Chair for Methods in Teaching Mathematics and Physics of the Moskva Oblast' Pedagogical Institute assumed the duty of organizing a mutual information program and rendering consultation on this subject.

Neutron radiation. Neutron radiation of rocks. N. M. Lyatkowskaya and G. V. Gorshkov. *Compl. rend. acad. sci. U. R. S. S.* 25, 747-50 (1939).—Neutron measurements in the atm. were carried out in a wooden house, built on a weakly active soil. Ionization current was measured in a boron chamber and in a Kolhorster counter with a borax screen and without one. As expected the B chamber and Kolhorster counter register the absorption of γ -rays in borax differently, since previous expts. show the B chamber is more sensitive to hard γ -rays than the Kolhorster counter. The intensity of neutron radiation of the soil studied was of the same order of magnitude as the intensity of cosmic neutrons at sea level. Therefore the intensity of neutron radiation of soil of normal activity (about 10^{-12} g. Ra/g.) should be much less than the intensity of cosmic neutrons at sea level.

TITLE: Emission of Neutrons^{1/4} by Rocks

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 133, No. 1, pp. 92-94

TEXT: In the paper under review, the authors try to calculate the rate of neutron production in the rocks of the earth crust, and to estimate the absolute neutron intensity on the strength of data published on the production rate of neutrons in different materials by taking account of cosmic radiation. Those three processes near the earth surface are mentioned in which neutrons are produced. Table 1 compiles the rates of neutron production in different materials, and the intensity of cosmic thermal neutrons is given. In order to estimate the rate of neutron production in the earth, it was necessary to calculate the rate of neutron production by nuclear processes occurring in the earth crust. Here, the authors refer to results obtained by V. I. Matviyenko, and a neutron output from granite is found to be $80.7 \cdot 10^3$ neutrons/sec.curie on an irradiation with α -particles. The authors obtained a neutron production per second and gram of granite

Card 1/3

81719

Emission of Neutrons by Rocks

amounting to $1.5 \cdot 10^{-8}$. Such neutrons were caused by the spontaneous decay of U²³⁸. $2.4 \cdot 10^{-7}$ neutrons/sec.g are produced by the radium content. $5 \cdot 10^{-7}$ neutrons/sec.g are produced by the α -radiation of the thorium family. It results therefrom that in granite, by nuclear reactions in the earth, approximately 50 times less neutrons are produced than in paraffin by cosmic radiation at sea level. Hence, a neutron flux of roughly 5 neutrons/cm² per day must be expected in granite rocks. This flux is beneath the measuring limit of modern instruments. The calculations made here show that the neutron flux in rocks with higher content of radioactive elements can be measured with modern instruments. The same may be possible with an increased content of some lighter elements. There are 1 table and 30 references: 7 Soviet, 15 American, 3 German, 1 Canadian, 1 Australian, 1 British, and 1 Swiss.

TITLE: Transient changes in the vector of dominant polarization PP according to observations at Lovozero

SOURCE: Geomagnetism i aeronomiya, v. 6, no. 3, 1966, 162-163

TOPIC TAGS: earth current, geomagnetic field, polarized signal

ABSTRACT: The authors have used data on variation in vertical magnetic component at Lovozero and records of earth currents for the same periods to examine the behavior of the vector of dominant polarization. It was noted that focal zones of earth current and of the geomagnetic field arise simultaneously and their contours are approximately the same. Centers of polarization are like beads on a necklace in their plot against time. For the period from June 9 to October 4,

Card 1/2

UDC: 550.385

L 23135-66
ACC NR: AP6006675

1964, twelve such necklaces were observed. Their plots allow comparison of vertical magnetic component and the E-W and N-S components of earth currents. The curves appear symmetrical and the maximums of these compared factors correspond closely. The direction of the polarization vector may change within about 30° from one necklace to another. Within a single necklace the variation is less than 10° . All components tend to decline rather uniformly. If it is assumed that the direction of the polarization vector is determined by the position of the source relative to the observation point, the patterns observed may be explained by a smooth shift of the source along a parallel, and changes in direction of the vector may be due to shifts north or south. If it is further assumed that the series of polarization positions represent superposition of several necklaces, the sources may be explained either as occupying a single locality or spread over several localities. If the first, the polarization should be expected to behave as in one of the observed necklaces; if the second, considerable and irregular changes in direction of the vector may be expected. The latter, of course, was not observed. The authors express their thanks to M. I. Pudovkin and B. Ye. Bryunelli for discussing the present paper and making suggestions concerning it. Title : Solubility of oxygen in liquid iron containing titanium

Periodical : Dok. AN SSSR 101/2, 325-326, Mar 11, 1955

Abstract : The solubility of oxygen was investigated in Fe-Ti fusions at 1600 and 1650°. The solubility was determined by establishing the equilibrium of the fusions in a vapor-hydrogen mixture of known composition. Experiments showed that with the rise in temperature the solubility of the oxygen in Fe-Ti fusions increases. Liquid particles of reaction products obtained from iron deoxidation with titanium were observed in cases when the Ti content in Fe-Ti-O fusions did not exceed 0.04%. Table.

TITLE: Determination of the Deoxidizing Capacity of Titanium
(Opredeleniye raskislitel'noy sposobnosti titana)

PERIODICAL: V sb.: Fiz.-khim. osnovy proiz-va stali. Moscow, AN SSSR,
1957, pp 245-256. Diskus, pp 332-334

ABSTRACT: The starting substances are described, problems having to do with the reaction of the oxides in the deoxidizing element and the crucible are discussed, as are matters pertaining to the nature of the non-metallic impurities. The thermodynamic characteristics of the reactions occurring upon reaction of Ti and O in liquid Fe are discussed. Melts were run in BeO crucibles, which had proved to be the best suited to this purpose. An investigation was made of the decoxidizing capacity of Ti in the 0.005 - 0.5 percent interval. It was found that the following reactions were dominant when the liquid Fe contained up to 0.04 percent Ti: $[T] + 4[O] + 2Fe_{(liq)} \rightarrow 2FeO \cdot TiO_2(laq)$.

Card 1/2 $\Delta F^\circ = -294,000 + 107.3 T$, while at Ti content of 0.04 - 0.05 percent the dominant reaction was $[T] + 2[O] + TiO_2(solid)$

137-1958-1-214

Determination of the Deoxidizing Capacity of Titanium

$\Delta F^{\circ} = -140,500 + 47.3 T$. As a deoxidizer, Ti lies between Si and Al. The effect of Ti dissolved in liquid Fe upon the activity of O and TiO_2 was determined.

TITLE: The burning-out of carbon in the converter process

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Chernaya metallurgiya. no. 7, 1960, 32 - 36

TEXT: A continuous and direct analysis of steel in the converter being still too difficult, the samples are analyzed after tilting. The method is connected with loss of time and impairs the life of converters. In principle, sampling is possible without stopping the blast, and the analysis lasts 5 - 6 min. Therefore the sample must be taken in the first half of the heat (in the 4th minute). The dependence of the carbon content (Z_C) on time must be known to determine the moment when the process is to be stopped. As proven by S. I. Filippov et al. (Ref. 2: Nauchnyye doklady vyshey shkoly, Metallurgiya, 1958, No. 2, 24) component elements burn simultaneously but at a different rate depending on the metal temperature the $Z_C = f(t)$ equation being determined by

Card 1/6

S/148/6^/000/007/018/023/XX
A161/A033

The burning-out of carbon in the

these rates. Two types of kinetic carbon burning curves have been found in experiments with a 8 kg laboratory induction furnace (Ref. 1: S. I. Filipov, Teoriya protsessov obezuglerozhivaniya stali (Theory of the steel decarbonization process) Metallurgizdat, 1956) below 1500°C the burning is slower, and above 1500°C in the second half of the heat it is higher and constant.

$$\frac{dZ_C}{dt} = B$$

At Z_C below 0.2 % C, the carbon oxidation rate is inhibited by diffusion. The constant carbon burning rate is taken as the basis of the US patent (Ref. 3: D. Murphy, US Patent No. 2807537, 1957). The purpose of the present work was to find the equation for the carbon burning curves throughout the converter heat (Figure 1) to apply electronic computers for the converter process control. Two heat groups were studied, with sampling at tilts, and by "freezing on". To eliminate the dependence on the iron charge and C content in iron (Z_C^0) a relative

value was used instead of Z_C , $\Psi = \frac{Z_C}{Z_C^0}$. The time moment value $\varphi = 0.7$ was chosen

Card 2/6

S/148/60/000/007/018/023/XX
A161/A033

The burning-out of carbon in the

for the time unit after a careful analysis. It corresponds to 3.0 - 3.2 % C in the metal bath, when Mn and Si in most cases are already no longer burning. This rated time is designated by τ . The carbon burning equation finally evolved for the case of air blast through bottom (curve 1 in Figure 3) is:

$$Z_C = Z_C^0 \exp (-0.331 \tau^{2.936}). \quad (3)$$

It can apparently be applied to any converter process. The equation for the carbon burning rate ω_c is easily obtained by differentiating the expression (3)

$$\omega_c = \frac{d\varphi}{dt} = -0.972 \tau^{1.936} \exp (-0.331 \tau^{2.936}) \quad (4)$$

The burning maximum is at $\tau = 1.265$, and the CO concentration in the separating gas is highest at this moment. The accuracy of the data obtained was checked by the "confidence interval method". Curves 3 and 4 present the results of calculations, with dependabilities 0.90 and 0.80. It was concluded that linear approximation is only applicable for short time intervals. The equation may be presented in the form of nomograms or tables. Computers would calculate the

p 130 (USSR)

AUTHOR: Lyaz'ko, Ye. M.

TITLE: A Comparative Study of Crystal-Bearing Quartz Veins and
Veins of the Alpine Type (Sравнительная характеристика
хрусталеносных кварцевых жил алпийского типа)

PERIODICAL: Mineralog. sb. L'vovsk. geol. o-vo pri ...-te, 1956,
Nr 10, pp 94-104.

ABSTRACT: Veins of the alpine type are considered by the author
to be formations of lateral-secretion origin, not
directly associated genetically with a magmatic source,
and developing under conditions of regional meta-
morphism. The characteristic features of these veins
are given. 1) They develop in folded regions during
the folding and regional metamorphism of rocks at com-
paratively shallow depth; the veins are controlled by
fault fractures. 2) The chemical-mineralogical compo-

Card 1/3

15-57-5-6606

A Comparative Study of Crystal-Bearing Quartz Veins (Cont.)

sition of the country rocks. 3) They exhibit a zonal structure and show a relationship between the width of the near-vein leached zone, and thickness of the vein filling, and the size of the crystals, on the one hand, and on the dimension of the fracture on the other. 4) There is a definite mineral association and order of crystallization. 5) There is no direct connection between the mineral-forming solutions and igneous rocks. It is necessary to differentiate between crystal-bearing quartz veins and alpine veins. The former always occur in rocks with a high content of SiO₂ and are characterized by various structural positions, by their occurrence in different types of fractures, and commonly, by complex morphology. They have a simple mineral composition (some groups, characteristic of alpine veins, are almost completely absent). These veins do not show a strict sequence in the order of deposition of the minerals. Leaching has been intense and solution of earlier formed crystals has occurred. The author believes that the crystal-bearing veins are hydrothermal and cites the following facts in support of this view: 1) the regional restriction of the veins to districts where single-aged granites occur; 2) the occasional

Card 2/3

15-57-5-6606

A Comparative Study of Crystal-Bearing Quartz Veins (Cont.)

intense hydrothermal alteration of near-vein rocks and the introduction of components foreign of the country rocks; 3) the specific local mineral content of the veins, not changing in relation to the country rocks; 4) the direct connection of some veins with massive granites, recognized by study of gas-liquid and liquid inclusions. The crystal-bearing quartz veins, being hydrothermal, are in contrast to the different ore-bearing formations, inasmuch as their most important feature is the extraction of components to the mineral complex of the veins.

TITLE: Electrochemical method for determining the thickness of palladium coatings

27

18

SOURCE: Zashchita metallov, v. 1, no. 6, 1965, 721-724

TOPIC TAGS: electrochemical analysis, metal coating, palladium

ABSTRACT: Electrochemical methods have been developed for determining the thickness of palladium (I) coatings. Whenever the color of the basic metal differed from that of I (copper, silver), the "drop" method was employed. It consisted of applying 13--14 drops of solution containing 7.5 g/liter of I₂ and 500 g/liter of KI per 1μ of coating to be removed. The time of action for one drop is 30 seconds. For other cases, an electrojet method was applied, using an apparatus assembled according to GOST 30C3-58 directions described earlier (Zashchitnye pokrytiya. Gosudarstvennyye standarty, M.: 1960). This method involved the use of the same solution as in the "drop" method, with rated coefficient of 25 sec/m for cylindrical samples and 30 sec/m for flat samples. All experiments were performed at 20 ± 0.5°C. The method was plant-tested, and showed an accuracy of ± 10%. It can not be used on coatings less than 1μ in thickness. It appears that the solubility rate for the coating depends upon the
