L.Yuboshits, I.I.

✓ 107. METHOD OF UTILIZATION OF FUEL FOR POWER AND CHEMICAL PURPOSES.

Yuboshits, I.I. (Trud. Inst. Energet. Akad. Nauk Belorusssk. SSR (Trans. Inst. Nauk Naute Ruse. S.S.R.), 1954, (1), 161-179; abstr. in Ref. Zh. Khim. (Ref. J. Chem., Moscow), 1956, (2), 765). In the scheme described peat is separated into fine (< 5 mm) and coarse (> 5 mm) fractions. The fine fraction, which comprises 80% of the total quantity, is subjected to low temperature carbonisation in suspension and extraction of liquid and gaseous products, while the coarse fraction is dried and fed to steam boilers, in which it is burned with the low temperature cotta. The peculiarity of the scheme is the division of the heating in low temperature carbonisation into two stages: (1) to 200-225°C by fine gases at 800-900°C, and (2) to 500°C by external heating in a heat exchanger by fine gases at 900-900°C. Redrying of the peat is effected by exhaust steam from the turbines and boiler fine gases. Thermal calculations are made and the scheme's advantages over that of Chukhrov and Nikolaev (Fuel Abstr., 1951, vol. 10, 2505) are pointed out.

TITLE Investigation of a New Grain-drying Method (Issledovaniye novogo metoda sushki zerna)

PERIODICAL Tr. In-ta energetiki AN BSSR, 1955, Nr 2, pp 114-161

ABSTRACT: Results are adduced of a shop investigation of a new suspension-type grain-drying method proposed by the author, wherein the principal novelty lies in the intermittent character of the desiccation process. Test results of a prototype of a grain-drying machine based on the proposed drying method have indicated a number of advantages over existing grain driers.

TITLE:

Contact Mass Exchange in a Layer of Granular Material

PERIODICAL:

Inzhenerno-fizicheskiy zhurnal, 1959, Nr 9, pp 47 - 51 (USSR)

ABSTRACT:

The paper describes a method of calculating contact mass exchange in a layer which consists of particles having different values of the potential of substance transfer. The dessication of materials by the method of contact mass exchange can find a wide application, in particular in drying granular materials. Making use of the analogy between the processes of heat and mass transfer, employed by A.V. Lykov [Ref 2], the author derives a system of equations, Formulae 8, 14, 15 and 16 in the text, which enables one to solve the problems of determining the kinetics of contact mass exchange for the cases when the values of the following quantities are known: c_1 and c_2 , specific mass capacities of both granular materials participating in the contact mass exchange, and R_1 and R_2 , coefficients of their resistance

Card 1/2

Contact Mass Exchange in a Layer of Granular Material

to mass transfer. When these values are unknown, a method can be used for their experimental determination, which is described in the article. There are 2 Soviet references.

TITLE: The Effect of the Time Rate of Stepwise Load Incrementation
on the Mechanical Strength Characteristics of Oak (Vliyanie
skorosti stupenchatogo nagruzheniya na mekhanicheskiye
kharakteristiki prochnosti duba)

PERIODICAL: Sb. nauch. rabot. Belorus. politekhn. in-t, 1956, Nr 54,
pp 156-166

ABSTRACT: Radial flexure tests were conducted on air-dried oak specimens
(10.7-11.3 percent moisture content), having a 26 x 20-mm cross-
section and a 400-mm span, by applying a load in equal incre-
ments and maintaining the load on the specimen for some time
after each loading step. The limit of plasticity σ_{plast} was
determined. When the duration of the test was increased from
8.6 - 9.5 minutes to 21.9 days, the tensile strength σ_t de-
creased from 904 - 922 kg/cm² to 752 kg/cm² and σ_{plast}
decreased from 486 - 488 kg/cm² to 382 kg/cm². It is readily
apparent that σ_{plast} decreases faster than σ_t . With slower

Ruditsyn, M. N., P. Ya. Artemov, and M. I. Lyuboshits

Spravochnoye posobiye po soprotivleniyu materialov (Handbook on the Strength of Materials) Minsk, Gos. Izd-vo BSSR, 1958. 508 p. Errata slip inserted. 20,000 copies printed.

Ed. (Title page): M. N. Ruditsyn; Ed. (Inside book): I. Chernyak; Tech. Ed.: N. Stepanova.

PURPOSE: The handbook is intended for design and manufacturing departments of machine-building plants and for students of technical schools.

COVERAGE: The book presents basic principles, working formulas, charts, and tables. It includes information on deformations and stresses in tension, compression, bending, torsion, and shearing, as well as on designs of beams, thick-walled cylinders, and thin-walled columns with open cross sections. The stability of elastic systems, the design of statically indeterminate systems, and elasto-plastic bending and torsion are discussed. Cyclical stresses and dynamic loading are explained. Data on the mechanical

Title : The pressure of saturated vapor of certain odoriferous substances. Part 2. -

Periodical : Zhur. Fiz. Khim., 28, Ed. 5, 810 - 813, May 1954

Abstract : The pressures of saturated vapor of benzyl acetate, cinnamic alcohol, phenylethyl alcohol, alpha-terpineol and indole were investigated by the effusion method at 10 - 55°. It was shown that the values obtained at the investigated temperatures could be quite accurately expressed by the Clausius-Clapeyron equation and integrated under the assumption of a constant concealed heat of evaporation (sublimation). Title : Determination of the saturated vapor pressure of certain aromatic principles

Periodical : Zhur. fiz. khim. 30/1, 177-183, Jan 1956

Abstract : The saturated vapor pressures of p-methylacetophenone, gamma-phenylpropyl alcohol, citral, d- and l-linalyl acetate, musk-xylene and benzophenone were measured at close to room temperatures. All aromatic principles but benzophenone were investigated in liquid state only. Benzophenone was studied in liquid and crystalline states. It was found that the vapor pressures of d- and l-linalylacetate, obtained from different raw materials, were practically identical. The results obtained from the other aromatic principles are shown in tables. Twenty-seven references: 11 USSR, 5 Germ., 1 Eng., 1 Swiss, 1 USA, 1 Danish (1925-1955). Tables; graphs.

AUTHOR: Lyuboshits, T. L.

TITLE: Heating of Disperse Materials in a Radiation Heat Exchanger

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, 1961, Vol. 4, No. 1,
pp. 76-81

TEXT: The author investigates the radiation heating of disperse material, which was used by him for the thermal decomposition of peat. By means of this method, a high efficiency is attained at temperatures of 550-600°C owing to the high heat exchange coefficient in the radiation heat exchanger. In this studies, the author proceeds from the heat exchange equation

$$Gc_m d\theta = \left\{ \frac{t_w + 273}{100} \right\}^4 - \left\{ \frac{t' + 273}{100} \right\}^4 c_{em} dF \quad (1)$$

Here G denotes the quantity of the material passing through the heat exchanger, c_m is the specific heat, and θ the temperature of the material,

Card 1/3

X

88272

Heating of Disperse Materials in a Radiation Heat Exchanger S/17C/6.1/004/001/010/020
B019/B056

t_w is the wall temperature, F the area of heat exchange, and c_{em} the radiation coefficient of the burning flow. With reference to A. M. Gurvich, A. G. Blokh, and A. I. Nosovitskiy (Ref. 2), the author, proceeding from (1) develops the following differential equation:

$$\frac{d\psi}{dF} + \frac{c_{em}}{c_m G} \left\{ \left(\frac{(t_{in} + 273)}{Lc} - \frac{Gc_m}{Lc} \frac{d\psi^4}{dF} \right) - \frac{100}{\psi^4} \right\} = 0$$

t_{in} is the initial temperature of the gas to be heated, c and L the specific heat of the gas to be heated and its quantity respectively. Solving this differential equation is difficult and is mostly approximated by dividing the heat exchanger according to its height into a number of sections. Here, a solution is suggested by using the balance equation $\alpha'(t_w - \psi) = k(t_g - \psi)$, where t_g is the gas temperature, α' a heat exchange coefficient between wall and material. The determination of α' for the upper and the lower end of the heat exchanger is discussed, and finally a formula is derived for the surface of the heat exchanger.

B013/B056

$F = c_m G(t_2 - \theta_1)/k_{mean}(t_g - \theta)_mean$, where k_{mean} is the mean value of the heat transfer coefficient from gas to material. Further, a formula is given for the height of the heat exchanger, and finally an example is discussed. There are 1 table and 3 Soviet references.

TITLE: Polarization Phenomena in Radiative Collisions of Two Electrons

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959,
Vol 37, Nr 6, pp 1727-1740 (USSR)

ABSTRACT: The two-row matrix formalism was used in describing the polarization phenomena in the collision of two Dirac particles of arbitrary energy. The radiative collision of two polarized electrons was considered. The structure of the general formulas for the polarization parameters after the collision was investigated, and concrete calculations were carried out in the ultrarelativistic and nonrelativistic limits with compensation for the polarization of the target electrons. There are 45 equations; and 15 references, 5 Soviet, 1 Italian, 1 U.K., 8 U.S. The 5 most recent U.S. and U.K. references are: J. Jhoseph, F. Rohrlich, Rev. Mod. Phys., 30, 354, 1958; H. TITLE: Covariant expansion of the electromagnetic field

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42,
no. 3, 1962, 846 - 856

TEXT: Two problems of covariant expansion of a free electromagnetic field are considered: a) expansion of a photon field with respect to electric and magnetic multipoles, b) expansion of field sources (current) with respect to multipole moments. The formulas are derived by using the irreducible tensors of the Lorentz group and the conception of the "little group" L_q of the four-vector q which is assumed to be time-like or lying on the light cone. In the first case L_q is anisomorphous subgroup of spherical symmetry. For the momentum k lying on the light cone, the little group L_k is an isomorphous space group for the diatomic molecule considered. After defining the covariant Stokes parameters, expressions for the covariant expansion of the photon field with respect to the

Covariant expansion of the...

$$\begin{aligned} \text{multipoles} \quad \mathbf{E}_{LM}(\mathbf{k}) &= L^{-\nu_L} (L+1)^{-\nu_M} |\mathbf{k}| \nabla_{\mathbf{k}} Y_{LM}(n), \\ \mathbf{M}_{LM}(\mathbf{k}) &= L^{-\nu_L} (L+1)^{-\nu_M} i[\mathbf{k} \nabla_{\mathbf{k}}] Y_{LM}(n). \end{aligned} \quad (15)$$

where

$$\begin{aligned} \mathbf{k} \mathbf{E}_{LM}(\mathbf{k}) &= 0, \quad \mathbf{k} \mathbf{M}_{LM}(\mathbf{k}) = 0, \quad \nabla_{\mathbf{k}} \mathbf{M}_{LM}(\mathbf{k}) = 0, \\ \mathbf{E}_{LM}(\mathbf{k}) \mathbf{M}_{LM}(\mathbf{k}) &= 0 \end{aligned} \quad (16)$$

are derived.

$$E_{mLM}^{(l)}(k) = L^{-\nu_L} (L+1)^{-\nu_M} \frac{1}{\sqrt{-P^2}} \left[k_m \left(P_n \frac{\partial}{\partial k_n} \right) - (kP) \frac{\partial}{\partial k_m} \right] Y_{LM}^{(l)}(n), \quad (25)$$

$$M_{mLM}^{(l)}(k) = \frac{1}{i\sqrt{-P^2}} L^{-\nu_L} (L+1)^{-\nu_M} e_{mlst} k_l \left(\frac{\partial}{\partial k_s} Y_{LM}^{(l)}(n) \right) P_t. \quad (26)$$

are obtained, which, if $\vec{P} = 0$, go over to (15) again. The expansion with respect to multipoles of the Fourier components of the electromagnetic field reads

$$A_m(k) = \sum_{LMl} e_{LM}^{(l)} E_{mLM}^{(l)}(k) + \sum_{LMl} m_{LM}^{(l)} M_{mLM}^{(l)}(k) \quad (27)$$

Card 2/5

S/056/62/042/003/033/049
B102/B138

Covariant expansion of the...

The functions $\gamma_{LM}^{(i)}(n)$ are tabulated for $M = 0, \pm 1, \pm 2$ and $L=0,1,2$. e_L and m_L are spinors with L dotted and L non-dotted indices. The covariant expansion of a charged-particle current with respect to multipole moments is achieved by a power expansion of

$$j_k(x, t) = \sum_i e_{(i)} v_{(i)k} \delta^3(x - x_{(i)}(t)), \quad (29)$$

$$\partial j_k(x, t) / \partial x_k = 0. \quad (29a)$$

and separation into current and charge density component:

$$j_k(x, t) = \sum_i e_{(i)} \dot{\xi}_{(i)k} \exp [-(\xi_{(i)} \nabla)] \delta^3(x) \quad (31)$$

$$(\dot{\xi}_{(i)} = \partial \xi_{(i)} / \partial t)$$

$$j = \sum_i \{ \dots + e_{(i)} \dot{\xi}_{(i)} - e_{(i)} \dot{\xi}_{(i)} (\xi_{(i)} \nabla) + \dots \} \delta^3(x), \quad (32)$$

$$\rho = \sum_i \left\{ e_{(i)} - e_{(i)} (\xi_{(i)} \nabla) + \frac{1}{2} e_{(i)} (\xi_{(i)} \nabla)^2 - \dots \right\} \delta^3(x). \quad (33)$$

Card 3/5

B102/B138

Covariant expansion of the...

For the particle trajectories $\vec{x}_{(i)}(t) = \vec{x}_c + \vec{\xi}_{(i)}(t)$ is valid. With

$$\sum_i \frac{1}{L!} \xi_{(i)\alpha} \xi_{(i)\beta} \dots \xi_{(i)\gamma} = Q_{\alpha\beta\dots\gamma}^{(L)}(t). \quad (34)$$

for the charge density expansion with respect to multipole moments

$$\rho = \sum_L (-1)^L Q^{(L)} \nabla^L \delta^3(x), \quad (35)$$

is obtained; ∇^L stands for the L-fold product $\nabla_\alpha \nabla_\beta \dots$. For the current

$$(\alpha, \beta, \gamma = 1, 2, 3)$$

$$j_\alpha = \left\{ \sum_{L=1}^{\infty} (-1)^{L-1} \frac{\partial}{\partial t} Q_{\alpha\beta\dots\gamma}^{(L)} \underbrace{\nabla_\beta \nabla_\gamma \dots}_{L-1} + \right. \\ \left. + \sum_{L=2}^{\infty} \sum_i \frac{L-1}{L!} e_{(i)} (\xi_{(i)} \nabla)^{L-2} (-1)^L \left[\left[\xi_{(i)} \xi_{(i)} \right] \nabla \right]_\alpha \right\} \delta^3(x). \quad (42)$$

Card 4/5

TITLE: Multipole expansions in decay processes

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44,
no. 2, 1963, 561-572

TEXT: The author, together with Ya. A. Smorodinskiy, has developed a relativistically covariant technique of considering the multipole radiation of classical charge systems. They utilised the irreducible tensors $T^{(u)}_{(i)u}$ of the small Lorentz group L_u ; u is the c.m.s. four-velocity, $u^{(i)}$ the four-velocity of the particles. This method is now applied to study the phenomenological structure of an electromagnetic vertex in the relativistic quantum theory. A covariant expansion of an arbitrary electromagnetic vertex in relativistic multipoles is set up. For this expansion (in terms of irreducible representations of the group L_u) it is of great importance that the velocity of the particles involved in the

Card 1/3

1 : 3

S/056/63/044/002/028/065

B102/B106

Multipole expansions in ...

decay considered are different before and after the decay. The method is demonstrated by the example of the decay $A \rightarrow B + \gamma$, in which the electromagnetic vertex has three free ends. The tensors are set up from the wave amplitudes of the particles involved. This is done by a transformation connected with parallel displacement of vectors and spinors in the Lobachevskiy space (cf. Smorodinskiy, ZhETF, 43, 2217, 1962). The electromagnetic transitions of elementary particles are investigated and the electromagnetic form factors are determined for $k^2 \neq 0$ based on the gauge invariance ($\Gamma^\alpha_\alpha = 0$) and the fact that $\Gamma_\alpha = M_{\alpha\beta} k_\beta$, where $M_{\alpha\beta}$ is an antisymmetric four-tensor dependent only on the spins of the initial and final nuclei, and k is the four momentum of the quantum emitted in the transition. The results obtained are also used to investigate the structure of the β -decay Hamiltonian $H = G j^{\text{nucl}} j^{\text{lept}} / \sqrt{2}$ in the theory of universal weak interaction, according to which $j_\alpha^{\text{lept}} = \gamma_1 \gamma_\alpha (1 + \gamma_5) / 2$ (Phys. Rev. 109, 193, 1958). The number of different types of form factors for β -decay of particles with arbitrary spin is calculated and tabulated. A relativistically covariant classification of the β -transitions is given

TITLE: On a possible method of determining the magnetic moment of the Σ^+ hyperon

SOURCE: Zh. eksper. i teor. fiz., v. 46, no. 6, 1964, 2221-2226

TOPIC TAGS: sigma particle, hyperon, magnetic moment, depolarization, meson reaction

ABSTRACT: In view of the great difficulties entailed in the determination of the magnetic moment of the Σ^+ hyperon by standard methods using spin precession in an external magnetic field, the authors propose a new method, which does not call for a magnetic field stronger than several thousand Gauss. The gist of the method is to replace the external field by the intra-atomic field, making use of the phenomenon of depolarization of positively charged parti-

Card

1/2

ACCESSION NR: AP4042587

cles in condensed media, a depolarization which is due essentially to the electron magnetic field, which acts in turn on the magnetic moment of the given particle. It is shown that in principle the magnetic moment of the Σ^+ hyperon can be determined in principle from an analysis of experimental data on the asymmetry of the $\Sigma^+ \rightarrow p + \pi^0$ decay in flight and upon stopping. It is also pointed out that an analogous method can be used to measure the magnetic moments of light hyperfragments. "The authors thank S. S. Gershteyn, I. I. Gurevich, V. G. Nosov, and I. V. TITLE: Effect of medium on properties of neutral kaon ⁰ antikaon ⁰ pairs

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 47,
no. 5, 1964, 1868-1873

TOPIC TAGS: K meson, K particle, pair theory, particle interference

ABSTRACT: The purpose of the investigation was to ascertain the influence of the medium on the interference phenomena occurring in $K^0\bar{K}^0$ systems and to estimate the accuracy of the usual approximation, within the framework of which the K^0 mesons are regarded as free. In estimating the influence of the coherent interaction of the K^0 and \bar{K}^0 mesons with the medium on the properties of the $K^0\bar{K}^0$ pairs

Card 1/2

L 16099-65
ACCESSION NR: AP5000345

the authors obtain a system of basic functions for such pairs in the medium, and note the specific features of the interference phenomena in the systems $K^0\bar{K}^0$, $K^0\bar{K}^0$, $K^0(K^0)$, and $K^0(\bar{K}^0)$. It is shown that the equations for $K\bar{K}$ pairs previously derived by one of the authors (Okonov et al., ZhETF v. 43, 720 and 1362, 1962), with the K^0 mesons regarded as free, are subject to an error which can reach 10% and which must be taken into account. AUTHOR: Baryshevskiy, V. G.; Lyuboshits, V. L.; Podgoretskiy, M. I.

TITLE: Resonance transitions of waves in the presence of splitting

SOURCE: Yadernaya fizika, v.1, no. 1, 1965, 27-31

TOPIC TAGS: resonant spin flip, wave nucleus interaction, polarized target interaction, rotating nuclear field, level splitting, resonance transition, neutron spin, neutron bombardment 19

ABSTRACT: The authors previously introduced (ZhETF, 47, 1050, 1964) the concept of a nuclear field connected with a polarized target and showed that such a rotating nuclear field acts on neutrons passing through the constant magnetic field in a manner similar to the action of a rotating magnetic field. Consequently, if the frequency of rotation of a nuclear field is equal to the level splitting of the neutron within the total nuclear and magnetic field, there occurs a resonant re-orientation of the spin of the neutrons. The present paper studies the case when the target consists of nuclei with spins larger than $1/2$. Such nuclei may exhibit quadrupole level splitting within the intracrystalline electric field, and during

Card 1/2

L 41009-65
ACCESSION NR: AP5007701

3

the passage of neutrons through such a target one may observe several resonant frequencies. The problem is treated theoretically and the results show a complete analogy with the case of ordinary paramagnetic resonance. The same type of reasoning is also applied to photons (changes in polarization) and K-mesons, and the authors conclude by pointing out that the resonant transition effects may be utilized for the design of directional monochromators (see G. M. Drabkin, ZhETF, 43, 1107, 1962). The extraction of particles with the desired energy may be achieved either by changes in the frequency of the applied field (nuclear, magnetic, electric) or by the changes in the period of the periodic interaction (produced by consecutive layers of appropriate material). "The authors thank S. S. Gershteyn and F. A. Shapiro for interesting discussions." Orig. art. has: 12 formulas.

AUTHOR: Lyuboshits, V. L.; Okonov, E. O.; Podgoretskiy, M. I.

TITLE: The galactic hypercharge field and decay of long lived neutral mesons into
two pi mesons

SOURCE: Yadernaya fizika, v. 1, no. 3, 1965, 490-495

TOPIC TAGS: galactic structure, galactic radiation, radioactivity, meson, meson
reaction, physics, mass energy relation, relativity, elementary particle, field
theory

ABSTRACT: The authors give a general analysis of the basic properties of classical
fields generated by nonconserved charges, basing their work on the "action by con-
tact" principle. By this principle they mean spatial localization of energy, and
finiteness of the speed of propagation of energy. It is shown that while intro-
duction of the above fields does not imply violation of energy conservation, these
fields cannot quantitatively explain the experimental results of Christenson et al.
(Phys. Rev. Lett., 13, 138, 1964). The authors also disagree with Ball, J. S. et al.
(Phys. Rev. Lett., 13, 348, 1964) and Bernstein, J. et al. (Phys. Lett., 12, 146,

Card 1/4

L 43126-65
ACCESSION NR: AP5011219

1964). These papers are said to contradict the principle of action by contact, which is basic to modern physics. In these papers, the decay $K^0 + 2\pi$ at large distance from the generation point is interpreted as the result of regeneration of K_1^0 mesons in the specific field of our galaxy. A general outline of some basic properties of the system consisting of hypercharges and the galactic field is given. The difference in the structure of such a system is the nonconservation of hypercharge in weak interaction processes. A similar situation is noted in the case of antigravitation problems, for here the hypercharge is responsible for mass attraction, positive for particles, negative for antiparticles. The authors confine their work to classical fields with nonconservation of charge g . The possibility of creation and annihilation of charge in g -fields leads automatically to breakdown of the equation of continuity and the nonconservation of g -current. Motion in this field will violate energy conservation only if certain poorly defined postulates are made. It appears that in making certain assumptions about the field, the assumption of violation of conservation is put in. Under certain conditions, certain cyclic processes appear nonconservative. The authors formulate basic postulates common for all classical fields, which hold for g -fields. Then they analyze energy relations for charge change in an external static g -field. Many other authors have used the assumption that in change of charge of particles found in a

Card 2/4

L 48126-65

ACCESSION NR: AP5011219

point A , their potential energy instantaneously changes by a value $\Delta g\phi(A)$ where Δg is the change in charge and ϕ is the field potential. This contradicts short-range action. Instantaneous change is possible only for finite speed of propagation of the reaction. The decay $\Lambda^0 \rightarrow N + \pi$ in the galactic g -field is analyzed from the point of view of short-range action. It is found that the energy of interaction of charges that are not conserved is not a single valued function of their interaction or of their mutual distribution in space. The problem of $K_2^0 \rightarrow 2\pi$ decay is considered. It is shown that the scheme for K meson formation in the galactic field that is assumed in the papers referred to and also the formation scheme for K_1^0 mesons in the gravitational field is inconsistent from the viewpoint of the principle of short-range action. If short-range action is valid, the regeneration of K_1^0 mesons cannot be affected by the potential created by charges which are a great distance from the neutral K meson. The actual effect of the g -field on the properties of the neutral K mesons is considered. It is concluded that the parameter of nonconservation of CP cited by Christenson cannot be generally applied to the system proposed in this article. Experiments done at different times at different points should lead to different results. Meanwhile, only a single experiment, that of Christenson, exists. Thus, in spite of the possibility of existence of a g -field with nonconserved charge, the $K_2^0 \rightarrow 2\pi$ decay which was experimentally observed by

Christenson cannot be explained within the "action by contact" theory as an effect of the regeneration in this field of K_1^0 mesons. "We are glad to thank V. G. Baryshevskiy, V. I. Ogivetskiy and A. V. Tarasov for participating in our discussions and for their valuable comments."

TITLE: Effect of interaction between neutrons and nuclei on the paramagnetic resonance width in a neutron beam

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 48, no. 4, 1965,
1146-1149

TOPIC TAGS: paramagnetic resonance, neutron beam, neutron interaction, polarization, resonance line width

ABSTRACT: This is a continuation of earlier work on resonance phenomena that occur in beams of slow neutrons (ZhETF v. 47, 1950, 1964 and Yadernaya fizika v. 1, No. 1, 1965). The present paper deals with paramagnetic resonance in a neutron beam with account of interaction between the neutrons and the target nuclei. The effect of polarization of the target on the width of the resonance line is investigated and it is shown that the width of the resonance line is determined by incoherent processes resulting in the escape of neutrons from the beam. The results are analyzed under the assumption that paramagnetic resonance can be regarded as

TITLE: On the scattering of neutrons on a polarized target

SOURCE: Yadernaya fizika, v. 2, no. 3, 1965, 441-444

TOPIC TAGS: nuclear magnetic moment, neutron scattering, quadrupole moment, neutron polarization

ABSTRACT: Neutron scattering on a polarized target placed in an external magnetic field is considered in the presence of quadrupole splitting of the levels of the target nuclei in an inhomogeneous intracrystalline electric field. It is shown that in both the scattered and the passing beam, a periodic variation of the intensity and polarization of the particles with time is observed. The phenomena arising during the crossing of the levels of the target nuclei are discussed. The results can be used to measure the magnetic and quadrupole moments of nuclei and to develop pulsating neutron sources. Orig. art. has: 4 formulas.

waves with a frequency $\Omega = \omega\Delta n/n_0$ (n is the refractive index and n_0 its isotropic part). The probability of the spontaneous transitions produced in the light is determined by calculating the matrix element of the operator of interaction between the transmitted light and the medium in the electric field. The relative magnitude of this effect is quite small, $10^{-15} - 10^{-16}$ for guaiacol [$C_6H_4(OCH_3)OH$] at $\Omega \sim 10^{14}$ sec⁻¹ and visible light, is barely at the threshold of detection if a laser light beam is used. 0

tions of atomic hydrogen in an external electric field, where noticeable interference effects can be expected even with weak fields, owing to the smallness of the separation between levels having the same J but different ℓ , and also between levels with different J . The transition between the first excited state and the ground state of hydrogen is studied by way of an example for which the actual calculations are made. It is shown that whereas in a homogeneous electric field mixing will occur between all the three levels $2P_{1/2}$, $2S_{1/2}$, and $2P_{3/2}$, and interference will occur for the E1 transitions because of the mixing, in the case when the Stark shift of these levels is much less than the separation between them (fields weaker than 500 v/cm), the $2P_{3/2}$ level mixes with the $2P_{1/2}$ level and noticeable anisotropy and partial linear polarization appear. Similar effects can occur for transitions between levels with larger quantum numbers. However, these come into play at considerably weaker fields. For an anisotropy in the angular distribution of radiation of about 0.1, the field required for the $2P_{1/2} \rightarrow 1S_{1/2}$ transition is 500 v/cm, but for the

TOPIC TAGS: K meson, pi meson, radioactive decay

ABSTRACT: A description is given of the decay properties of a mixed ensemble of neutral K-mesons with the help of the two-row density matrix method. The case in which the neutral K-meson is contained in a $K^0\bar{K}^0$ system is considered in detail. Interference effects in the decay of neutral K-mesons into two π -mesons, when CP-invariance is violated, are discussed from a new point of view. Orig. art. has: 42 formulas. [JPRS: 36,712]

TITLE: The interaction between a uniformly moving boundary dislocation and admixture
atoms in anisotropic face-centered cubic crystals

SOURCE: AN SSSR. Doklady, v. 164, no. 5, 1965, 1037-1040

TOPIC TAGS: crystal lattice dislocation, single crystal, crystal defect, crystal lattice
energy

ABSTRACT: Starting from the atomistic approximation of the discontinuum, the authors
investigate theoretically an infinite single crystal containing a single unit linear dislocation
and a foreign atom. The principle of superposition for displacements is valid in the entire
volume, except for the region of the nucleus with the singularity around the dislocation axis.

The establishment of a general expression for the energy contribution is followed by a discussion of certain special cases (which reduce to cases known from scientific literature), and by the application of the theory to the particular case of an infinite single crystal with face-centered cubic lattice representing a solid substitution solution of noninteracting admixture atoms of low concentration. Results are not compared with the existing data. The paper was presented by Academician G. V. Kurdyumov, 27 May 65. Orig. art. has: 18 formulas.

Lyubov, B. Ya. Solution of a non-stationary distribution problem of heat conduction for a region with uniform transmission at the boundary. Doklady Akad. Nauk SSSR (N.S.) 57, 551-554 (1947). (Russian)

The physical problem reduces to the solution of $T_{tt} = a^{-1}T_{xx}$ subject to $T(x, t) = \phi(t)$ for $x=0$, $t \geq 0$, $T(x, t) = \psi(t)$ for $x=ct$, $t \geq 0$, $\phi(0) = \psi(0) = 0$. A solution of the form

$$T(x, t) = (\pi a)^{-\frac{1}{2}} \int_0^t [a(y)e^{-(t-y)/a} + b(y)e^{-\alpha/(t-y)}] (t-y)^{-\frac{1}{2}} dy,$$

$\alpha = \frac{1}{2}x\alpha^{-\frac{1}{2}}$, $\beta = \frac{1}{2}c\alpha^{-\frac{1}{2}}$, is tried. Using the Laplace transform on the equations resulting from the substitution of the boundary conditions, $a(y)$ and $b(y)$ are obtained.
