SOURCE: Kokubo

, v. 15, no. 2, 1966, 26-42

TOPIC TAGS: mineral, ~~mineral industry~~, economic planning, industrial development, map, petroleum, ~~petroleum~~, government

ABSTRACT:

Japanese military specialist Toshio Maeda describes China's need, in view of the situation in Vietnam, to secure her industries in case of military conflict by more adequate geographic decentralization. With the help of maps and charts he describes the plans for doing this. The author also discusses raw materials (minerals, coal, petroleum, etc.) and various industries (including the iron and steel, coal, petroleum, electrical industries). The study is based on Chinese, Japanese, and other sources.

Maga ✓ The chemical and technical characterization of the tannin
and of the extract of the root of sea lavender. Gh. Alexa,
Cost. Strub, Cornelia Maga, and Irina Iarănschi-Drăbic.
Acad. rep. populară Române (Iasi), Studii cercetări print. 3,
225-39 (1952).—The ext. of the root of sea lavender con-
tains a mixt. of pyrogallol and catechol tannins. The best
extn. temp. is 80-90°. The ext. is weakly astringent and
can be used for tanning fine skins which must remain soft
after tanning. Emanuel Merdiner.

Mark

The influence of temperature and time on the composition and properties of a dry oak extract. Cost, Strub, Irina Iarosinschi-Drabici, and Cornelia Maga, Acad. rep. populare Române, Filiala Iași Studii cercetări științ. 5, No. 1/2, 173-87 (1954).—It has been shown that by an initial drying of tanning ext. (hot air at 100°) to produce "atomized ext." less tanning agents are required when compared to the necessary proportions in conventional tanning. The following were studied: (a) changes in the analytical compns. of oak exts. under the influence of temp. and time, and (b) the conditions under which these transformations promote the quality of the tanning ext. The expts. justify the conclusions that: (1) insol. particles are degraded to form absorbable particles which have tanning properties, (2) tanning agents are formed through polymerization or condensation of prot-tannins, and (3) the transformations are more or less reversible, and are functions of temp. and treatment time. By working under dtd. conditions, the obtained ext. is composed of tanning fractions of different astringency, but approx. of an equal capacity to be fixed irreversibly on the skin fiber, thus leading to a uniform tanning.

T content in the leaves, achieving its greatest magni-
tude for I of 51.76%, for II of 47.62%. Yellow leaves of
I have a lower T content (12.43%). The T content in the
yellow leaves of II is the same as in the red, with a
higher Q of the extract (52.91%). The optimum harvest
period corresponding to the maximum T content is the end
of October for leaves of I and the end of September for
leaves of II. During an intense exposure of an insulated
II tree to sun rays, even yellow leaves contained 14.85%
T; however, the d extract Q (43.54%) was somewhat lower
than in the red leaves. The optimum temperature of extract-
ion for leaves of I and II is 90-100°. Drying of the leaves
by warm air immediately after harvest increases the quantity

the relation of the quantity of water to the quantity of TM. The quantity of extracted T during various conditions of extraction (length 2 hours, 1 hour at 50-70° and 1 hour at 70-100°) decreases with an increase in the dimensions of particles of TM and comprises 9.33, 8.56, 4.00 (in % to the quantity of TM) with a degree of pulverization of 2-3 mm, 3-7 mm and 7-15 mm respectively. An increase of the duration of extraction to 3 hours at an constant temperature increases the quantity of T to 10.29% (with a degree of pulverization of 2-3 mm), decreases the quantity of NT and the quantity of IS in the residue of TM. A further increase of the duration of extraction reduces still more the quantity of US in the

Abs Jour: Ref. Zhur-Khimiya, No 11, 1958, 38451.

residue of TM, decreases the quantity of T and increases the quantity of NT in extraction, which indicates to a great degree the splitting up of T under the action of temperature, as a result of which they are analytically determined as NT. For TM of a size of 7-15 mm, a maximum quantity of T (7.03%) is obtained through heating for 10 hours (6 hours at 50-70° and 4 hours at 70-100°). At any degree of pulverization, the TM quantity of T increases with an increase in the ratio of the quantity TM to the quantity of water from 4:1000 to 4:47, after which it decreases again; in this way, it changes the quantity of NT.

55.00, 53.67, 62.23, 60.30, 56.61 and 64.83 respectively. The high Q indicates the value of fir bark as a tanning material that can be used for the improvement of the Q of extract from the bark of the fir (Picea). The quantity of extracted T increases with the duration of extraction (E), but this increase decreases with the growth of the tree. Sharp increases of temperature in the process of E decreases the output of T and Q. The addition of sulfite during E increases the output of T from the bark of 80-year-old firs by 8-15%, depending on the duration of E. The removal of resinous substances from bark before E does not improve the output of T with Q.

Abstract : experimental pituitary hypertonia (PH) also accompanied by CI. l was administered by mouth in doses of 0.2 g twice daily for a period of 3 weeks. In 3 of the 5 monkeys with SH and in all 3 monkeys with PH blood pressure dropped to normal. In the other 2 monkeys with SH blood pressure remained high. A considerable diminution of modifications characteristic of CI (the negative T-wave became positive; if an extra systole was present, it disappeared) was noted in a number of monkeys on the electrocardiogram. The contracting capacity of the myocardium improved. The authors recommend the application of l in hypertension accompanied by CI.

Vulcanism and metallogeny of the Zeravashano-Gissar
Mountain Region. I. G. Magak'yan and N. N. Stolov
Soviet Geol. 8, No. 6, 49-62 (in English, 62-3, 1938).
Related to the granitoid and quartz-schistites of the upper
Paleozoic are hypothermal scheelite, arsenopyrite, galena
and stanniferous pegmatites and epithermal fluorite,
barite, calcite and antimonite. F. H. Rathmann

The mineralogy and genesis of the skarn zones of the Zeravshan ridge. I. G. Magak'yan. *Mém. soc. russe minéral.* 68, No. 2, 317-37 (1939); *Khim. Referat. Zhur.* 1939, No. 11, 24.—The ores of the skarn zones of the Zeravshan ridge are divided into skarn ores and quartz-sulfide ores. The amts. of the basic minerals for the ores of the 1st group (pyroxene, amphibole, quartz, pyrrhotite, magnetite, chalcopyrite, marcasite, garnet, calcite, scheelite)

ite) and for the ores of the 2nd group (quartz, arsenopyrite, cassiterite, sphalerite, pyrrhotite, galena, chalcocite, stannite, pyrite, scheelite, calcite) are given in vol. percentage. A schematic paragenetic table of the main minerals of the skarn zones shows that the process of ore formation (which evidently took place at wide intervals of time) was characterized by temp. limits of from 700-800° to 400-100°. The total no. of chem. elements taking part in the process was 38; the elements of the ordinary (upper) field of Fersman's geochem. table and the sulfide or metallic elements predominate. The most characteristic elements of the ores were S, Fe, Cu, Zn, As, Mo, Sn, W, Pb and Bi. It is possible that some of these may have been added in the form of volatile compds. The genesis of the skarn zones is discussed in detail (especially that of the Taklim formations) and the chronological continuity of the processes of formation of the skarns as well as of the quartz-sulfide ores connected with them. The peculiarity (together with scheelite) of a no. of sulfides (mainly of arsenopyrite) and of Sn minerals (cassiterite and stannite) which are sep'd. from the skarns in the form of nests and veins which produce commercially important concns. of the minerals.

Opyt klassifikatsii postmagmaticheskikh mestorozhdeniy. Zapiski Vsesovuz.
mineral. o-va, 2-ya seriya, 1949, vyp. 3, s. 195-206. -- Bibliogr: 25 nazv.

CA

Tentative classification of the postmagmatic deposits
P. M. Tatarinov and I. G. Magak'yan. *Zapiski Vsesoyuznogo Mineralogicheskogo Obschestva* 78, 193-200 (1949). For the practical application of genetic classifications of ore deposits, the geol. factor of the depth in which the mineralization took place must not be neglected. Among the criteria the depth factors are specific indications for the chem.-reactions which took place. In the high-temp., deep-seated mineralizations, simple compds. or native elements prevail, and often solid solns. occur. In deposits near the surface, often complex compds. are formed at the relatively low temps. of a hydrothermal, epigenetic mineralization, and exsolv. phenomena prevail over the formation of solid solns. Examples are given for (1) exhalation deposits, correlated to volcanic phenomena, and (2) postmagmatic deposits, i.e. hydrothermal and initially high-temp. mineralizations, included the pneumatolytic reaction types.

W. Etel

CA

Practical classification of ore types. I. G. Magak'yan.
Zapiski Vsesoyuz. Mineral. Obshchestva (Mém. soc. russe
minéral.) 79, 241-67 (1950). M. extensively discusses and
tabulates a classification of ore deposits which comprises
the following characteristic features: (1) a nomenclature of

42 different types, which are by characteristic ore minerals
or chem. elements; (2) the typical mineral assocts.; (3) the
most characteristic metals and elements of the ores con-
cerned; (4) the geol. position of the ore mineralization
(5) the morphological features of the ore body, and the char-
acteristics of its formation (geol. history); (6) the gen-
esis of the ore minerals, and their textual relations; (7) the
most important regional and local designation of the ore de-
posits; (8) the geol. age and designation of the stratigraphic
horizons; (10) short indications on the practical importance
of the deposits; and (11) their genetic type in outlines, and
the depth (temp. region) of the genesis. A second table
gives the geochronological details, classified after the ages,
from the Archaean to Quaternary horizons, for the most im-
portant ore types, and a location (only general indications of
the continents, countries, and most characteristic geol.
units). The text accompanying the tables is a discussion of
the distinction of the given classification from the previous
systems of Ussoy (1933), Schneiderhohn (*Fazlagerstätten*,
1944 (C.A. 39, 8007)), Bogdanovich (1913), and Betecktin
(*Izvest. Akad. Nauk. S.S.R., Ser. Geol.* 1945, No. 6).
The geochem. relations are easily recognized, as in the para-
genetic assoct. of minerals of grouped elements. Regional
conditions of the geol. and chem. types are discussed for the
deposits of the Western Pacific girdle, the Caucasus-Balkan-
Italian, and the North American deposits. The conditions
in geosynclines and anticlines, compared with those in plat-
form forms, are discussed.
W. Eitel

AUTHOR: Magak'yan, I.G.

TITLE: A world metallogenetic map and some distribution patterns for ore deposits in the crust

SOURCE: International Geological Congress, 21st, Copenhagen, 1960. Doklady sovetskikh geologov, problema 20: Prikladnaya geologiya; voprosy metallogenii. Moscow, Izd-vo AN SSSR, 1960, 5-18

TEXT: The author discusses a world metallogenetic map compiled by him on a tectonic basis with due emphasis on the two main types of crustal structure: platforms and mobile zones of Caledonian, Hercynian, Cimmerian, and Alpine folding. Tables are given for the geographic distribution of different kinds of mineralization in such environments. Platforms appear to be characterized by a Pre-Cambrian metallogeny associated with later mineralization in the vicinity of major fault-zones. They are

Card 1/4

S/630/60/000/020/001/004

A world metallogenetic map ...

conspicuous for their rare-metal pegmatites and deposits of Au, U, loparite, carbonatite, and diamond, which complement the metamorphogenic ores of Fe, Mn, Au, U and Cu-Ni. Regardless of the age of the fold zones four successive metallogenetic stages are distinguished: the early stage (I) of basic and ultrabasic intrusives and effusives - with copper-pyrite mineralization and magmatic Pt, Cr, and titanomagnetite deposits; the middle stage (II) of moderately acid intrusives - with Fe-Cu-W-Mo skarns and Sn-Mo-Pb and Zn-Au-Sb-Hg deposits; the late stage (III) of acid-granitoid intrusives - with rare-metal pegmatites and Sn-Cu-Mo-Pb and Zn-Au-Sb-Hg hydrothermal deposits; and the final post-folding stage (IV) - with low-temperature deposits of Au-Ag, Sb-Hg, As, W, and U ores. Starting from the Hercynian epoch, it is also possible to delineate two different types of metallogenetic province: one with the preponderance of I and II, and the other with the predominance of III. This trend is explained firstly, by the fact that the closing of a geosynclinal cycle

Card 2/4

S/630/60/000/020/001/004

A world metallogenic map ...

D228/D3Q3

may terminate metallogenic development before III; secondly, by the fact that many orebodies are formed only during III; and, thirdly, by the fact that III is favored by special tectonic conditions - zones of maximum stress and subsidence in which the siallic shell undergoes intense refusion. The principles used in constructing the 1:22,000,000 color map, given in another of the author's publications (*Osnovy metallogenii materikov* (Bases of the Metallogeny of Continents), Izv. AN ArmSSR, 1959), and the small-scale monotone version reproduced in this article take into account the genetic grouping of deposits and the designation of the major metal and mineral association. This guarantees the legibility and reflection by the map of the six chief factors controlling the metallogeny of a given area: 1) the type of major crustal structure; 2) the intensity of the manifestation of a particular stage (or stages) of structural development and its corresponding magmatism and endogene mineralization; 3) the spatial isolation (or superimposition) of structural-

Card 3/4

S/630/60/000/020//001/004

D228/D303

A world metallogenic map ...

metallogenic zones with definite mineral-ization; 4) the depth of the parent magmatic focus; 5) the depth of erosional truncation; and 6) the lithologic features of the host-rocks. The author illustrates the significance of these factors by referring to the relevant features of various ore deposits. In conclusion it is stated that the regular distribution of different types of mineralization - and their replacement in time and isolation in space - occurs within major structures which is considered to be of practical significance in the appraisal of a territory's mineral-potential. There are 1 figure, 2 tables, and 1 Soviet-bloc reference.

TITLE: Final Results of the First All-Union Volcanological Conference

PERIODICAL: Izvestiya Akademii nauk Armyanskoy SSR. Geologicheskiye :
geograficheskiye nauki, 1960, Vol. 13, No. 1, pp. 79-84

TEXT: The First All-Union Volcanological Conference convened by the Laboratoriya vulkanologii AN SSSR (Laboratory of Volcanology AS USSR) jointly with the Institut geologicheskikh nauk AN ArmSSR (Institute of Geological Sciences AS Armyanskaya SSR) was held at Yerevan from September 23 to October 2. It was attended by 650 volcanologists and geologists representing 70 geological institutes from Moscow, Leningrad, Kiyev, Lvov, Tbilisi, Baku, Sverdlovsk, Tomsk, Vladivostok, Khabarovsk, Magadan, Vronezh, Petropavlovsk-na-Kamchatke, North Caucasus, Kola Peninsula, Moldaviya and other regions. 100 lectures were delivered. The following problems were specially dealt with: 1) "Active Volcanism and Bases for Its Study" 2) "Volcanic Provinces and Formations as Well as Useful Minerals"

Card 1/9

Volcanological Conference

S/172/60/013/001/003/003
B023/B058

Connected With Them" and 3) "Volcanism and Tectonics". At a special symposium, the Conference delegates studied problems of terminology and nomenclature of volcanic rocks. A number of lectures giving a survey of the problems in question were delivered at the plenary sessions: V. I. Vlodenavets, G. S. Gorshkov, and S. I. Naboko reported on "Problems of the Study of Present Volcanism in USSR"; on behalf of V. I. Vlodenavets, A. P. Lebedev and G. N. Gapeyev, A. P. Lebedev, Doctor of Geological and Mineralogical Sciences, reported on the problems of reconstructing the history of volcanism and the determination of the regularities of its development. Further, mention is made of lectures by: V. N. Kotlyar and M. A. Favorskaya on correlations of some types of mineralization with effusive formations; G. S. Gorshkova, S. I. Naboko, K. K. Zelenova on the present volcanic activity; N. A. Kozyrev on "The Existence of Lunar Volcanic Activity"; A. V. Khabakov on "Characteristics of the Formation and Development History of the Lunar Surface"; S. K. Vsekhsvyatskiy on "Comets, Problems of the Solar System and Terrestrial Volcanism". 4 lectures, the theme of which were the following volcanic provinces of the USSR, dealt with the

Final Results of the First All-Union
Volcanological Conference

S/172/60/013/001/003/003
B023/B058

second problem: Caucasus, Ural, Far East Coastal Region, Ukraine, Carpathian Mountains, Russian Plate, (Soviet) Central Asia, Kazakhstan, Sakhalin, Kamchatka and others. The discussion after the 17 lectures on the third theme was very lively. The meetings continued for five days. Under the heading: "Resolution of the First All-Union Conference", the authors give a review of tasks to be carried out. In the introduction, they report that volcanism is at present being studied in the USSR by a number of Scientific Establishments of the Academy of Sciences USSR, the Academies of Sciences of the Union Republics, the Ministerstvo geologii i zekhrany nedr SSSR (Ministry of Geology and Conservation of Mineral Resources) and schools of higher education. The authors enumerate main trends of volcanological studies which were noted by the Conference delegates. These are first of all: 1) Study of the regularities in the development of the present and past volcanism in the USSR by methods of general geology and petrography, geophysics, geochemistry and physical chemistry. 2) Clarification of the regularities in the formation and distribution of useful minerals which are related to volcanism. 3) Study of geothermal conditions of the earth and the practical utilization of

Card 3/9

Final Results of the First All-Union
Volcanological Conference

S/172/60/013/001/003/003
B023/B058

heat from the depth. 4) Forecasts of volcanic eruptions and classification into volcanic zones. 5) Study of volcanism as a planetary and cosmic phenomenon, especially of lunar and planetary volcanism. The Conference delegates were of the opinion that all achievements and successes in the field dealt with do not correspond to the requirements of present geological theory and practice. The Conference delegates made the following decisions concerning the first part, main problems of volcanology: The elaboration of the following volcanological problems is to be considered a primary task: 1) Extension and intensification of studies on recent and latest volcanism. 2) Study of past and youngest volcanic formations of the USSR. 3) Considerable increase of volcanological studies in ore bearing areas and areas offering a possibility of utilizing the heat from the depth. 4) Development of theoretical petrography and geophysics especially in the study of development and evolution conditions of magma as well as the relation between volcanic and plutonic processes. 5) Intensification of studies in the field of volcanogenic metallogeny of geosynclinal and plate zones. 6) Clarification of the structure of the earth crust in areas of recent and latest volcanic activity. 7) Extension of geochemical

Card 4/9

Final Results of the First All-Union
Volcanological Conference

S/172/60/013/001/003/003
B023/B058

and geothermal studies and intensification of geophysical studies.
5) Increase of special experimental investigations on simulating natural processes, manufacture of synthetic volcanic products and characterization of physical properties of matter at increased temperature and pressure;
9) Intensification of the studies of cosmic volcanism in the solar system conducted at the Pulkovskaya observatoriya (Pulkovo Observatory) and the Kiyevskiy gosudarstvennyy universitet (Kiyev State University). Concerning the second part, investigation methods, the elaboration and intensification of the following investigation methods is necessary for the quick solution of the problems enumerated on the level of world science: 1) In the fields of present volcanism: a) development of seismic, magnetometric, gravimetric and geodetic studies, as well as the production of an automatic and telemetric apparatus for recording the dynamics of volcanic processes; b) detailed geothermal studies as well as the erection of operating observation stations; c) elaboration of geochemical methods and the apparatus for the study of volatile magma components and of products of their reaction with rocks and waters. 2) In the field of past volcanism, it is

Card 5/9

Final Results of the First All-Union
Volcanological Conference

S/172/60/013/001/003/003
B023/B058

necessary to elaborate methods for the study of volcanogenic formations and methods for producing paleovolcanic charts, to intensify studies on paleomagnetism and to apply the methods for determining the absolute growth of volcanic rocks widely. Concerning the third part organization measures studies on the youngest volcanism have so far been mainly concentrated at the Institutes of the AS USSR and the Academies of the Republics. The study of present volcanism was conducted at the Laboratoriya vulkanologii AN SSSR (Laboratory of Volcanology AS USSR) with its peripheral experimental stations. Apart from the great amount of work done, the Conference delegates are of the opinion that the studies do not correspond to the growing requirements and that it is necessary: 1) to ask the Presidium of the AS USSR to establish a volcanological service in the USSR fitted with most up-to-date geophysical and other apparatus, and capable of solving problems of volcanism on the level of present world science. The greatly enlarged Laboratory of Volcanology of the AS USSR, as well as its specialized Institutes should act as leading centers of the volcanological service. The latter should be situated directly in the areas of active volcanism; 2) to ask the Councils of Ministers of the Union Republics of

B023/B058

Armeniya, Gruziya, Azerbaydzhan and the Ukraine to organize Scientific Center Laboratories for volcanology and geothermy at the Academies of these Republics; 3) to ask the Presidium AS USSR, Ministerstvo geologii i okhrany nedor SSSR (Ministry of Geology and Conservation of Mineral Resources) Glavnoye upravleniye po geologii i okhrane nedor RSFSR (Main Administration of Geology and Conservation of Mineral Resources of the Russian Socialist Federative Soviet Republic) to organize laboratories, departments and groups for volcanology at a number of Branches of the Academy of Sciences and of geological territorial administrations, whose it would be to study the history of the volcanism of corresponding areas and minerals existing there; 4) to charge the Komissiya po drevnemu vulkanizmu (Commission for Past Volcanism) at the Laboratory of Volcanology of the AS USSR with coordinating the activities of the laboratories and groups mentioned; 5) to establish a commission for the elaboration of unified classification and nomenclature of volcanic rocks, consisting of delegates from the Laboratories for Volcanology of the AS USSR, IGEM (Institute of Geology of Mineral Deposits Petrography and Geochemistry), the Vsesoyuznyy geologicheskiy nauchno-issledovatel'skiy institut (All-Union Geological Scientific Research

Institute), Institut geologicheskikh nauk Arm. AN (Institute of Geological Sciences ArmAS), Geologicheskiy institut Gruz. AN (Geological Institute of the Academy of Sciences of the Gruzinskaya SSR), Moskovskiy gosudarstvennyy universitet (Moscow State University) and other organizations participating in the activities of the present Conference; 6) to convene All-Union Volcanological Conferences at least every three years in order to publish the results of volcanological studies; to convene the Second All-Union Volcanological Conference at Petropavlovsk on Kamchatka in '96; 7) to convene annual symposia for the purpose of discussing individual problems of volcanology; to convene the first symposium in March '960 and to put up for discussion problems of the present steam-hydrothermal processes and their metallogeny; 8) to ask the Presidium AS USSR to extend the publications by the Laboratory of Volcanology and to provide the means for the publication of the activity of the present Conference. The commission consisting of I. G. Magak'yan, Academician AS Armyanskaya SSR, G. S. Dzotsenidze, Academician AS Gruzinskaya SSR, V. I. Vladavets, Director of the Laboratory of Volcanology AS USSR, Professor B. I. Plyp.

Corresponding Member AS USSR, and F. K. Shipulin, Doctor of Geological and Mineralogical Sciences, is charged to bring the results of the present Conference to the notice of the following institutions: Tsentral'nyy Komitet Kommunisticheskoy partii Sovetskogo Soyuza (Central Committee of the Communist Party of the Soviet Union), Central Committees of the Union Republics, Presidium AS USSR, Ministry of Geology and Conservation of Mineral Resources, Gosudarstvennyy planovyy Komitet Soveta Ministrov SSSR (State Planning Committee of the Council of Ministers of the USSR) and other interested bodies. The Commission is entitled to elaborate supplementary proposals concerning the development of further volcanological studies in the name of the Conference delegates, and to submit these proposals to the organizations mentioned; to inform the Second Volcanological Conference of the results of the realization of the present resolution. 9) To ask the Presidium of the AS ArmSSR to publish the Conference resolution and to make it known to a large body of geologists and other specialists engaged in studying volcanism.

Group 2 included reports on--
endogenous deposits in other synclinal regions, such as mercury formations in
Siberia and the Far East (V. A. Kuznetsov), pyrite deposits in the Ural (S. N.
Ivanov), Kimeridgian and Alpine metallogenesis in Uzbekistan (I. Kh. Khamrabayev);
ore region types in the Pacific area (Ye. A. Radkevich); metallogenesis in Tadzhik-
istan (K. I. Litvinenko); hydrothermally transformed rocks in the Trans-Carpa-
thian region (M. Yu. Fishkin) peculiarities in magmatism and metallogenesis of the
Mountaneous Crimea (V. I. Lebedinskiy), antimony-mercury fields (M. A. Karasik)
and others. Group 3 included reports on the classification of metallogenous zones
and provinces of the Earth crust (D. I. Gorzhevskiy); classification of metallo-
genous zone types of the Earth crust (V. N. Kozerenko); classification of mag-
matogenous non-metallic mineral resources as a basis of prognoses and prospecting
(V. P. Petrov); types of metallogenous provinces in synclinal regions of the
USSR (A. I. Semenov); principles of geological zoning on the example of Central
Asia (K. L. Babayev); comparative characteristics of metallogenesis in Malyy Caucasus
and the Kamchatka-Koryak zone (I. G. Magak'yan), some peculiarities of metallo-
geny in the Mediterranean geosynclinal region (O. A. Tvalchrelidze); rootless
plutons and some peculiarities in the magmatism of moving zones (A. P. Lebedev);
paragenetic ore complexes (P. S. Saakyan) the part of deep-lying breaks in
metallogenesis of syncline regions on the example of the Caucasus (E. Sh. Shikhali-
beyli). The closing report was read by A. V. Sidorenko, Minister of Geology and
Preservation of Mineral Resources of the USSR.

TITLE: A Technical and Economical Comparison of Rope-Percussive and Core Drilling Under the Conditions of the Kadzharan Deposits (Tekhniko-Ekonomicheskoye sravneniye udarno-kanatnogo i kolonkovogo bureniya v usloviyakh Kadzharskogo mestorozhdeniya)

PERIODICAL: Razvedka i Okhrana Nedr, 1958, Nr 2, pp 22-24 (USSR) ²⁴

ABSTRACT: The author proves by detailed calculations that, under the specific conditions of the Kandzharan deposits (soft rocks and shallow bore-holes), rope-percussive boring is much more economical and gives better results than core drilling.
