time moment with equal probability will take on the values 0 and 1. The stochastic matrices $\pi_{ij} = \pi_{ij}(t)$ are discussed, for each of which there exists a number m such that $\pi_{ij}^{(m)} = 0$ or 1 for all i, j , where all π_{ij} are integer numbers. The algorithm is presented which will afford construction of the class of automata to realize such stochastic matrices. V. Matvinyuk

TITLE: The realization of stochastic matrices by finite automata

CROSS SOURCE: Sb. Vychisl. sistemy, Vyp. 8. Novosibirsk, 1963, 65-70

TOPIC TAGS: finite automaton, Boolean logic, Markov chain, stochastic matrix, stochastic matrix algorithm

ABSTRACT: Finite automata are discussed, synthesized from Boolean logic elements, including delays. If the random vector of inputs at time t does not depend upon the information referring to the preceding time moments, then the sequence of automaton states will form the homogeneous Markov chain characterizing some stochastic matrix of transient probabilities. The given finite automata will realize this stochastic matrix. It is assumed that each input fed at any

TITLE: Some calculations of counter telescopes. The light transmission power of a vertical telescope

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 5, 1961, 2-3, abstract 5
G 16. (Tr. Yakutskogo fil. AN SSSR. Ser. fiz., 1960, no. 3,
46-49)

TEXT: The author solves the problem of determining the absolute intensity N of cosmic rays recorded per unit time by a counter telescope. The angular distribution of radiation intensity is assumed to be $I(\theta, A) = I_0 \cos^2 \theta$, where θ is the zenith angle, A is the azimuth, I_0 is the vertical intensity ($\text{cm}^{-2} \text{sec}^{-1} \text{steradian}^{-1}$). On the basis of the general solution obtained for the problem, the directivity pattern of a vertical counter telescope located 20 m below the earth's surface is calculated. The definitive expression has the form: $b(\theta, A) = I_0 \cos^2 \theta S(\theta, A)$.

ducing five fractions without distillation. The demonstration showed that the first fraction contained 60% of C₂₁-C₂₅ acids; the second- 57% C₁₇-C₂₀ acids; the third - 85% C₁₀-C₁₆ acids. Their purity is higher than that of commercial acids prepared by distillation. The fourth fraction is a 90% concentrate of C₇-C₂₀ acids containing all resinous substances from which pure acids can be separated by distillation at 1480 and 5 mm Hg. The fifth fraction is a mixture of 35-40% monocarboxylic C₄ -C₆ acids and 50-55% dicarboxylic C₈ - C₁₆ acids. These acids can be readily separated by simple distillation since the former boil up to 1200, while the latter in the 205-2450 range at 5 mm Hg. Orig. art. has 5 figures, no formulas, 2 tables.

TITLE: Synthetic fatty acids prepared by carbon dioxide decom-
position of soaps

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 1, 1964, 23-26

TOPIC TAGS: monocarboxylic acids, dicarboxylic acids, soap decom-
position, synthetic fatty acids

ABSTRACT: Decomposition of technical soaps by carbon dioxide under pressure (not described) permits the preparation of synthetic fatty acids different from the commercial grades prepared by distillation. The reason for this difference is the concentration in the first fraction of all unsaponified compounds left after thermal processing; all dicarboxylic acids concentrate in the last fraction. To demonstrate the results of soap decomposition by carbon dioxide, the SZhK and ZhK technical soaps made by the Shebekinskiy Kombinat, were treated in an experimental installation in three steps, pro-

when there are sharp deviations of the dc/dz gradient. The new method is advantageous through these parameters used to analyze acoustic processes. The authors were able to determine two types of vertical distributions of the sonic velocity in a 10 degree square of the North-west Atlantic. The warm Gulfstream influences the first distribution type and can be divided into five layers. The cold Labradorstream influences the other distribution type and can be divided into four layers. Fig. 2 shows both distribution types. The authors thank V. Ya. Tolkachev, G. I. Merinova, N. P. Markova, and N. A. Smirnova for the calculations done. The Gosudarstvennyy okeanograficheskiy Institut (State Institute of Oceanography) is mentioned. Legend to Fig. 2: A is the first type of the velocity distribution and B the second. There are 2 figures and 4 Soviet references.

TITLE: Vertical Profile of Sound Propagation Velocity in the Ocean

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 135, No. 3, pp. 581-583

TEXT: The authors describe a new method of determining the sonic velocity in dependence of the depth of the ocean, using the so-called "characteristic points". The ocean depth is divided into a certain number of layers, taking their physical and chemical characteristics into account. Each curve which characterizes the mutual dependence of sonic velocity and ocean depth is approximated by a broken line, where the dc/dz gradient is constant within each individual layer (c is the sonic velocity, z is the ocean depth). The salient points of this curve are the characteristic points in the $c-z$ plane, for which the mean depth and the sonic velocity are determined. By changing in time the curve $c = c(z)$, a family of curves is obtained which describe the actual conditions much better especially

TITLE: Fluorination of liquid acetonitrile with free fluorine

13

SOURCE: Zhurnal obshchey khimii, v. 36, no. 8, 1966, 1419-1420

TOPIC TAGS: fluorination, acetonitrile, free fluorine, fluorine

ABSTRACT: A study has been made of the fluorination of liquid acetonitrile with free fluorine rarefied with nitrogen. The reaction was conducted at 10—15°C with vigorous agitation. There were no flares or explosions. Hydrogen fluoride formed in the reaction slowed down fluorination and had to be bound with sodium fluoride. The reaction products were fluoroacetonitrile, difluoroacetonitrile, N-fluoro-1,1-difluoroethylamine, and N,N-difluoro-1,1-difluoroethylamine. The reactions can be represented as follows:

TITLE: Reactions of hexafluorodimethylnitroxide¹

SOURCE: AN SSSR. Doklady, v. 168, no. 2, 1966, 344-347

TOPIC TAGS: chemical reaction, halogen oxygen nitrogen compound, fluorinated organic compound

ABSTRACT: Reactions of hexafluorodimethylnitroxide (I), which was described in an earlier paper by S. P. Makarov, A. Ya. Yakubovitch i dr. (Zhurn. Vsesoyuzn. khim. obshch. im. D. I. Mendeleyeva, no. 1, 106, 1965; DAN, 160, 1319, 1965), with ethylene, tetrafluoroethylene, acetylene, benzene, tetrafluorohydrazine, phosphorus trichloride and trifluoride, lead and tin are described. Photolysis and pyrolysis of I were also investigated. The structure of the reaction products was analyzed by means of elementary analysis, mass spectroscopy, determination of molecular weight, and by formation of derivatives. It was established that in some reactions I acts as a typical free radical while in others as an oxidizing agent releasing its oxygen. Photolysis leads to dimerization of I, while pyrolysis at 350C results in

was decomposed by a gas of which was sulfur which at $p = 20^{\circ}\text{C}$, condensing into a yellow-colored crystals.

With respect to the ESR spectrum, the value of the g-factor ($g = 2.0046$) establishes the spin nature of the paramagnetic in the molecule. The curves of the hyperfine splitting, observed for this compound in carbon tetrachloride solution, are given; the ESR spectrum was found to consist of nine signals with a corresponding intensity ratio. It is noteworthy that, when exposed to UV light, nitrogen hexafluoride reacts with methyl iodide to form a compound which, on heating, readily dissociates and forms $\text{CF}_3\text{N}=\text{O}$.

The half lives of Er^{157} and Ho^{157} were found to be 24_{-4}^{+2} and 18_{-4}^{+2} minutes, respectively. While the existence of Er^{157} and Ho^{157} was previously predicted in the literature, no data on the existence of Er^{158} have ever been published. The half life of Er^{158} could not be reliably identified, but an upper limit of 10-12 minutes was estimated for it. It is pointed out in the conclusion that observation of the same isotopes was subsequently reported by A. Gizon et al. (Phys. Nucl. Ann. 1964, Inst. du Rad., Paris, April, 1965) with somewhat different values of the half lives. Orig. art. has: 1 formula.

TOPIC TAGS: erbium, holmium, isotope, half life

ABSTRACT: The search for new erbium and holmium isotopes was made with the aid of a magnetic β spectrometer with three successive foci and with a scintillation γ spectrometer. The compounds for the investigation were separated chromatographically from a tantalum target bombarded with 660-Mev protons in the OIYaI synchrocyclotron. The chemical separation of the rare earths started approximately ten minutes after the end of the irradiation, and that of the erbium and holmium fractions after two hours. The genealogical connections were investigated in the following proposed chains of decay reaction:

S/020/62/142/003/017/027
B106/B110reacts with diphenyl ketene to form the adduct $(C_6H_5)_2CCO \cdot 2CF_2NH$.

Addition reactions with hydrogen fluoride, hydrogen chloride, and mercuric fluoride following the schemes

are very characteristic for the polyfluorinated azomethines in question. The tendency of polyfluorinated substances with double bonds to addition reactions with olefins therefore decreases as follows: $N=O > N=N > N=C$. Table 1 shows the physical constants of the compounds synthesized for the first time. There are 1 table and 12 references: 4 Soviet and 8 non-Soviet. The three most recent references to English-language publications read as follows: E. E. Griffin, R. N. Haszeldine, Proc. Chem. Soc., 1959, 369; 1960, 1151 - 1155; C. E. Griffin, R. N. Haszeldine, J. Chem. Soc., 1960, 1398; J. Crawford, J. Polym. Sci., 45, No. 145, 261 (1960).

vigorously when heated to 25°C in an autoclave to form O-NCP₃, which decomposes into trifluorinated dimethyl carbodiimide and methyl isocyanate when heated to 350 - 400°C in vacuo. These reactions demonstrate the great tendency of the N=O groups of trifluoronitroso methane to addition reactions with nucleophilic and electrophilic compounds. For comparison, some additions similar to the above reactions were conducted with polyfluorinated azomethines: CF₃N=CF₂ (Bp. -33°C) and CF₃N=CFCl (Bp. -50°C). In all cases, the additivity of the C=N groups of these compounds was much lower. On reaction of CF₃N=CF₂ with diphenyl ketene (autoclaved for 12 hrs at 180°C), not addition, but dimerization of the initial substance took place. The dimer also formed in almost quantitative yields by reaction between CF₃N=CF₂ and pyridine at -70 - 50°C. With aniline, the dimer converts into the anilide of the monomer, when subjected to pyrolysis (>500°C) it dissociates into the monomer (CF₃N=CF₂). Unlike the polyfluorinated azomethines above, difluoro formimine easily

ketene even more easily under the formation of $(C_6H_5)_2C\begin{smallmatrix} \parallel \\ | \\ \parallel \\ O-NCF_3 \end{smallmatrix}CO$ which

decomposes when heated to 300°C mainly forming trifluoromethyl isocyanate (Bp. 33°C, yield 35%) and traces of trifluoronitroso methane. The latter also reacts with $R_FC\equiv COX$ alkynes ($X = Cl, Br; R_F = CF_3, CF_2Cl, CFCl_2$) at room temperature in an autoclave. $O\begin{smallmatrix} \parallel \\ | \\ \parallel \\ ROOCN-NCOOR \end{smallmatrix}NCF_3$ forms on heating trifluoro-

nitroso methane with azodicarbonic acid esters to 100 - 150°C under pressure. Diazomethane and trifluoronitroso methane react at -70°C to give a polymeric nitron $[CF_3N(O)CH_2]_n$ under nitrogen separation

Phosphazines and trifluoronitroso methane react violently at -70°C following the scheme $(C_6H_5)_3P=N-N=CH_2 + CF_3NO \rightarrow CH_2O$

$+ [(C_6H_5)_3P=N-N=CF_3] \xrightarrow{-N_2} (C_6H_5)_3P=NCF_3$. The product of this reaction also forms from triphenyl phosphine and trifluoromethyl azide under the same conditions. Trifluoronitroso methane and methyl isocyanide react

TITLE: Reactions of polyfluorinated nitroso-alkanes with unsaturated compounds

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 142, no. 3, 1962, 596 - 599

TEXT: Trifluoronitroso methane is used as an example of some reactions of polyfluorinated nitroso-alkanes with unsaturated compounds. These addition reactions take place easily (in an autoclave at -70 to 0°C). Monomers and polymers containing 1 mole of nitroso compound per olefin mole, form. Styrene and trifluoronitroso methane also form a compound with the molar ratio 1 : 2 which decomposes into 1 mole of nitroso compound, formaldehyde, and the corresponding imine when heated to 70 - 80°C. fluorinated azo compounds are particularly sensitive to nucleophilic reagents. The reaction rate with amines grows with the amino basicity, and the reactivity in azo compounds of the type $\text{CF}_3\text{N}=\text{NR}$ drops in the sequence $\text{R}=\text{CF}_3 > \text{CF}_2\text{H} > \text{CH}_3$. With secondary amines, mercaptans, and sulfinic acids, the azo compounds react as follows:

These conversions probably begin with the formation of a transition complex of the type of a π -complex, e. g., $\text{CF}_3\text{N}=\text{NCF}_3$. This assumption

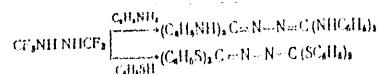

is backed by the fact that the transition complex, in the reaction of hexafluorazo methane with trialkyl phosphites, can be isolated under mild

Heterolytic transformations of...

Hexafluoro hydrazomethane reacts with aluminum chloride to form the dimer of tetrafluoro formazine, and, if oxidized in anhydrous media ($\text{KMnO}_4 + \text{CH}_3\text{COOH}$), it passes over to the intensively yellow cis-form of hexafluorazo methane, which readily takes the almost colorless trans-form under the action of light, alkali lyes, or metals. In the reduction of azoalkanes which contain the groups CF_2Cl or R_fCF_2 , the corresponding hydrazo compounds cannot be isolated, due to hydrolysis. The compound $\text{CF}_3\text{NNHC}_6\text{H}_5$ can be distilled in vacuo (b.p. $56^\circ\text{C}/1\text{ mm Hg}$), and passes over to indazole under the action of hydrogen iodide. Under the action of strong acids, the azo group of polyfluorazo alkanes is able to add one proton which, in the case of asymmetric azoalkanes, is added to the nitrogen atom adjoining the more electronegative substituent. These reactions take place most readily in anhydrous hydrofluoric acid, whereby polyfluorazo alkanes are dimerized into benzidine derivatives. Poly-

TITLE: Heterolytic transformations of polyfluorinated azoalkanes

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 142, no. 2, 1962, 354-357

TEXT: A number of heterolytic transformations of polyfluorinated azoalkanes was discovered for the first time. The said azoalkanes, while being highly resistant to oxidizing agents, easily react with reducers (HI , H_2S , H_3P) in polar media (ether, methanol) at low temperatures, whereby the azo group is converted into the hydrazo group. Hexafluoro hydrazomethane presents acid properties and is relatively stable in the solvate form in ether or acetone. The etherate reacts with ketene, and the normal diacyl derivative is formed as a result. Hydrogen fluoride is readily separated from hexafluoro hydrazomethane under the action of bases:

TITLE: Reaction of Halogen, Nitrogen, Oxygen, and Polifluorinated Ethylenes in Ultraviolet Light. Synthesis and Thermal Decomposition of Polyfluorinated Aliphatic Nitroso Compounds

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol. 30, No. 7,
pp. 2409 - 2415

(P)

Summary: In continuation of their earlier paper (Ref. 1) the authors studied the reaction of polyfluorinated ethylene with NO and halogen in ultraviolet light. They assumed that atomic chlorine or bromine would attack the formation of β -halogen nitroso compounds. In fact, the carbide with β -dichloro-dichloro-ethane results in good yields. This compound can be refluxed in the reaction between NO, Hal₂, and olefin. The pyrolysis of

polyfluorinated alkenes and could be isolated (compound 6 in the table). The structure of this compound was determined by theoretical calculations. The corresponding dieno alkenes were obtained in the same manner. The authors obtained mixtures of NO + Cl₂ or NO + Br₂ with polyfluorinated ethylenes (such as tetrafluoro- α -bromo-chloro- γ -methyl-ethylene at the ratio olefin : NO : Hal₂ = 1 : 1 : 1/2). These compounds have an intensive blue color, and are stable liquids. Besides them also the corresponding alkyl-nitroso chlorides as well as β -dihalogen halide compounds are always obtained from the reaction. Probably they are products of partial reductions of the starting compounds. In reducing the nitroso compounds obtained from trifluoroethylene by means of hydrogen iodide the corresponding fluorinated dichloro- and bromo-difluoro-acetyldienoic acids were formed, which indicates the addition of the halogen to the CP₂ group of the olefin. In the reaction between NO, Hal₂, and olefin, the pyrolysis of

The ClCP₂NO and NOCP₂CF₃O nitroso compounds at 120-130° yield the polyfluorinated ethylenes ClCP₂CF₃ — CP₂Cl and NO₂CP₂CF₃ — CP₂Br, respectively. There are 1 table and 8 references; 3 Soviet, 7 US, and 2 German.

TEXT: In continuation of the papers (Refs. 1-7) on the reactions of nitroyl halides with halogenated ethylenes the authors studied the reaction of N_2O_3 with polyfluorinated ethylenes where trifluoroethylenes might have been expected as is the case with non-fluorinated unsaturated compounds. In the reaction of N_2O_3 in the resonance state with tetrafluoroethylene at room temperature a liquid or deep-blue color, 2-nitro-1,1,2,2-tetrafluoroethylenone, is readily formed (Ref. 6,7). Besides this main product (yield more than 60%) a dinitro derivative of tetrafluoro-

(2)

ethylene and a small amount of non-halogenated high-boiling products is formed from NO_2 and trifluoro-chloroethylene. The nitroso compound is synthesised by the authors and some other scientists (Refs. 3,8,9), as well as other polyfluorinated nitroso compounds, are rather stable, and form no dimer. In this paper a series of new nitroso compounds obtained from tetrafluoroethylene show characteristic absorption bands of the valence vibrations of the bonds $\text{N}=\text{O}$ and $\text{C}=\text{C}$, and $\text{C}=\text{O}$, and $\text{C}=\text{N}$ which practically agree with the frequencies observed in the compounds obtained by J. Mason (Ref. 10). The same nitroso compounds are formed in the action of NO_2 with tetrafluoro- or trifluoro-chloroethylene and on irradiation with ultraviolet light. The reduction of the nitroso-nitroso compounds with hydriodic acid in ether medium yields the acid fluorine or nitro-difluorooctyldioxan acid which was separated as etherate of ($\text{NO}_2\text{C}_2\text{F}_5\text{OCN}$). The structure of the nitro-nitroso compound which was obtained from N_2O_3 and trifluoro-chloroethylene is shown in the

Card 2/3

reaction the addition of N_2O_3 takes place in such a way that the nitro group is linked with the carbon atom which has a higher electron density. There are 17 references: 4 Soviet and 4 German.

Fluorination of Silver and Potassium Cyanates S/079/60/030/007/036/039/xx
B001/B066

hypofluorite FOCN could not be detected in the fluorination products, which may be explained by a further fluorination on the $\text{C}\equiv\text{N}$ bonds according to the formula

$\text{MeOC}\equiv\text{N} \xrightarrow{\text{F}_2} [\text{FOC}\equiv\text{N}] \xrightarrow{\text{F}_2} [\text{FOCF}_2\text{NF}_2] \xrightarrow{\text{F}_2} \text{FOCF}_3 + \text{NF}_3$. This formula is in accordance with the fluorination of potassium cyanate, but not with that of silver cyanate. Thus, another formula had to be found for the fluorination of the cyanates. The authors have previously found that in the heterogeneous fluorination of the complex $[\text{CH}_3\text{CN}\cdot\text{BF}_3]$ fluorine adds chiefly to the $\text{C}\equiv\text{N}$ bond to form $\text{CH}_3\text{CF}_2\text{NF}_2$ (Ref. 9). Therefore, the above fluorination takes place presumably according to the formula

$\text{MeOC}\equiv\text{N} \xrightarrow{\text{F}_2} [\text{MeOCF}_2\text{NF}_2] \xrightarrow{\text{F}_2} [\text{MeOCF}_3] + [\text{NF}_2]$. As a result of further conversion of the trifluoro-methylate of the metal, which is formed as an intermediate, carbonyl fluoride or trifluoro methyl-hypofluorite may be formed. There are 12 references: 2 Soviet, 12 US, and 3 German.

TITLE: Fluorination of Silver and Potassium Cyanates

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol. 30, No. 7, pp. 2374-2377

TEXT: The authors describe the heterogeneous fluorination of silver and potassium cyanates. The initial cyanate was mixed with calcium fluoride and treated with elementary fluorine diluted with nitrogen at 25-55°C. The fluorination of silver cyanate gives carbonyl fluoride COF_2 (72%) and carbonic acid (24.5%). No nitrogen-containing products were detected, which may be due to the conversion of cyano-nitride to elementary nitrogen; it was difficult to confirm the presence of the latter because of the considerable dilution of the initial fluorine with nitrogen. Silver cyanate is quantitatively converted to silver difluoride. On fluorination of potassium cyanate, trifluoro methyl-hypofluorite, CF_3OF (80%), and nitrogen trifluoride, NF_3 (60%), were separated in addition to potassium fluoride and small quantities of carbonic acid and carbonyl fluoride. The expected

the isomeric formulas (I), (II), (III):

To confirm the structure of this product its infrared spectrum was examined. There is a band characteristic of the C-H bond. One band group is caused by vibrations of the C-F bond. An intense band may be assigned to stretching vibrations of the N-F bond. These results and further spectroscopic data (Ref. 6) indicated that the structures (I) and (II) of the product $\text{C}_2\text{H}_2\text{NF}_3$ are not confirmed spectroscopically, which fact speaks in favor of formula (III). This assumption is also supported by the presence of two bands in the infrared, which may be regarded as deformation vibrations of a three-membered ring. The structure of the products discussed may be that of fluorinated ethylene imine. The second product with the molecular weight 117 does not decolorize the aqueous-alkaline KMnO_4 solution. Its molecular weight and elementary composition correspond to the formula $\text{C}_2\text{H}_3\text{NF}_4$. In its infrared spectrum there are absorption bands which may be assigned to the N-F and C-H bonds, and a band group appears which is due to C-F vibrations. All these properties indicate

79-28-4-40/60

A Production Method for Fluorine Derivatives of the Organometal Compounds
of Silicon, Tin and Sulfur

the authors already before in the synthesis of ethylsilane-
fluorides (Ref 3):

The reaction of acetyl fluoride with alkoxy compounds of sulfur was investigated at the example of dimethyl sulfate. On that occasion formed the methyl ester of the fluorsulfonic acid with a yield of 60 % at conduction of acetylfluoride vapor into boiling dimethyl sulfate. From the experimental results comes out that the reaction of the carboxylic acid fluorides with alkoxy compounds of various elements is a commonly applicable important method for the synthesis of the concerned fluorine compounds. As the initial products - alkoxy compounds of the concerned elements and carboxylic acid fluorides - in general are easily accessible compounds, the described method earns general preparative interest. In an experimental part exactly are described the synthesis and the properties of diethylethoxy tin fluoride, diethyl tin

79-20-4 40/60

A Production Method for Fluorine Derivatives of the Organometal Compounds of Silicon, Tin and Sulfur

to which the alkoxy groups are bound, is an electropositive element. Thus alkoxy compounds of tin exchange the alkoxy groups in case of reaction with acetyl fluoride already in the cold for fluorine. At the corresponding compounds of silicon and sulfur, the exchange takes place at heating up. In all cases the fluorine compounds form with high yield. By alteration of the ratio of the reaction partners in the case of polyalkoxy compounds not only one but also a higher number of alkoxy groups can be exchanged. So, e.g., from diethyldiethoxy tin a mono- and a difluoride can be obtained; of tetraethoxy tin in case of surplus of acetylfluoride easily forms the tetrafluoride.

The reaction of acetyl fluoride with alkoxy silanes was investigated at the example of tributoxy silane. In this case forms in case of heating up to "80" tributoxyfluorsilane with a yield of 60 - 70 %. The reaction of tetraethoxysilane with benzoyl fluoride was investigated already before by Peppard, Brown and Johnson (Ref 2), but these authors could not observe any exchange of the alkoxy groups for fluorine. Polyfluorsilanes are obtained more easily by Grignard's reaction from silicon tetrachloride, which was observed by

TITLE: A Production Method for Fluorine Derivatives of the Organo-metal Compounds of Silicon, Tin and Sulfur (Metod polucheniya fторпропицвдных кремнезема, олова и серы)

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 4 pp. 1036-1038 (USSR)

ABSTRACT: In the series of the elementorganic compounds very often alkoxy groups, which are bound to the concerned element, are by action of acid chlorides exchanged for chlorine. The possibility of the analogous exchange of alkoxy groups for fluorine by reaction with acid fluorides has up to now been investigated yet specially. The authors investigated this reaction at alkoxy compounds of silicon, tin and sulfur. On that occasion showed up that the acid fluorides of carboxylic acids, in particular the easily accessible acetyl fluoride, react with the alkoxy compounds of the named elements under formation of the corresponding fluorides:

$$R_m E_l (OR')_{n-m} + CH_3COF \rightarrow R_m E_l (OR')_{n-m} F + CH_3COOR'$$

The described reaction takes place easier if the central atom,

ISSR/Chemistry - Organometallic Compounds, Arsenic Compounds Sep 52

"Synthesis of Organo-Elemental Compounds of the Aliphatic Series by the Diazo Method. I. Synthesis of Compounds of Group V Elements - Antimony, Arsenic, and Bismuth-Organic Compounds,"
A. Ya. Yakubovich, S. P. Makarov.

"Zhur Obshch Khim" Vol 22, No 9, pp 1528-1534

The diazo method was successfully used for the synthesis of antimony, arsenic, and bismuth-organic compds. From antimony trichloride and tri-(chloromethyl)-stibene were obtained, while from diazoethane, di-(alpha-chloroethyl)-chlorostibene was obtained. Antimony pentachloride added in a molar ratio to diazomethane reacts under formation of antimony trichloride. In the reaction of arsenic trichloride with diazoethane, di-(alpha-chloroethyl)-chloroarsine or tri-(alpha-chloroethyl)-arsine may be obtained depending on the ratio of reagents. The latter is an unstable compd which normally decomposes on standing. Bismuth trichloride reacts with diazomethane to form an unstable oxide of chloromethylbismuth, which after treatment with HCl, yields unstable chloromethylidichlorobismuth.

PROCESSES AND PROPERTIES INDEX

C.A.¹⁰

SYNTHESIS OF HETERO-ORGANIC COMPOUNDS BY THE DIAZO METHOD. SYNTHESIS OF COMPOUNDS OF ELEMENTS OF GROUP IV. A.Ya. Yakubovich, S.P. Makarov, V.A. Ginzburg, O.I. Gavrilov, and E.N. Merkulova. Doklady Akad. Nauk S.S.R., 72, 69-72 (1950); cf. C.A. 44, 8320a. - Halides of

Sn, Pb, and Si react progressively with diazo compds. with formation of RCHX derivs. and elimination of N₂. Chlorides and bromides react well at 0-5° in C₆H₆ and give the entire possible spectrum of substituted products in 40-80% yields; usually the ease of reaction declines with increased degree of substitution around the central atom. The reagent ratio may control the relative ratios of the products formed only to a moderate extent. Mixed products may be similarly obtained with partly substituted halides. SnF₄ does not react, but SnCl₄ and SnBr₄ react well. SnCl₄ gives semisubstituted derivs. of 4-valent Sn; thus is Bi₂O with CH₃N₂, it gave apparently $C_6H_5Sn(CH_3SnC_6H_5)_2O-Bi_2O$. In C₆H₆ high-nol. products form, apparently via formation of CH₃SnCl₃ which reacts with Sn⁴⁺, and yields equivalents of

the type —Sn₂CH₃CH₃(Sn₂CH₃CH₃)₂—, polymerisation being aided by traces of moisture. PbCl₄ and the NH₃ salt of chloroplumbic acid fail to react, probably owing to insol. Pb(OAc)₄ reacts with CH₃N₂ yielding N₂Pb(OAc)₄ and CH₃(OAc)₂. Alkylation of the Pb-X link was done only with di- or triethyl- lead chlorides when activated by Cu bronze; although chloromethyl derivs. were obtained the chloroethyl derivs. were too unstable to be isolated. SiCl₄ and SiBr₄ react too vigorously at room temp., but give normal products at -45°; RSiCl₃ and R₂SiCl₃ react slower than SiCl₄ or RCHXSiCl₃. Higher temps. favor formation

Title : Spotty Necrosis and Shrivelled Arms of Grapes.

Orig Pub : Izv. Moldav. fil. AN SSSR, 1956, No 1, 91-113.

Abstract : Spotty necrosis, called "chernilka" in Bulgaria, causes mass shrivelling of sleeves and shafts (shriveled arms) of grape-vines. The disease appears in the shape of dark brown spots on the bast. Spots of dead tissue appear on the vine which comes in contact with the soil in the sheltering ditch, more often in the second half of winter. The main cause of the disease is the frequent change of positive and negative temperatures in the soil where the vine is sheltered. The previous summer's drought, and also other causes, worsen the physiological preparation for wintering and enhance the deterioration. Soil fungi may increase the damage caused by

C111/C333

$x_1^{(m)} = (x_{k1}^{(m)}, \dots, x_{N1}^{(m)})$ of (3).

The equation (1) and (3) are identical for $m = 1$, for $m = n$ (3) is a scalar equation $d|X|/dt = |X| \operatorname{tr} P$, where $\operatorname{tr} P = \sum_{i=1}^n p_{ii}$ is the trace of P . If all $p_{ij}(t)$ are limited in one interval, then so are all $p_{kl}^{(m)}(t)$; if all $p_{ij}(t)$ are periodic, then the scalar system of equations (2) is regular and reducible. The expressions of the elements $p_{kl}^{(m)}$ by the p_{ij} are given for all $m = 2, 3, \dots, n-1$ and $n = 1, \dots, 6$; the corresponding matrices are found in an appendix. As application of the properties of (2), mention is made of the A. M. Lyapunov method for calculating the invariants of the characteristic equation of system (1) with periodic $P(t)$.

Minor systems of differential . . . C111/C333

$x_{ij}^{(m)}$ which are compiled from the elements of the determinant $|X|$ of matrix X . It is proven that the matrix X^m of the matrix equation (which the author designates as a minor equation) satisfies

$$\frac{d}{dt} X^m = P^m(t) X^m \text{ for all } 1 \leq m \leq n \quad (2)$$

where the elements of the matrix $P^m(t) = (p_{kl}^{(m)}(t))$ ($k, l = 1, \dots, N$;
 $N = C_n^m$ -- the number of combinations of m elements from n) depend linearly on the elements $p_{ij}(t)$ of $P(t)$. Since (2) is a Cayley-Hamilton equation relative to the equation

$$\frac{d}{dt} X = P(t)X \quad (3)$$

X^m is, therefore, the matrix of the fundamental system of the solutions

VII. THE AN-OPOL' LINE OF DEVELOPMENT FOR PETROLEUM PROCESSING
INTERVIEW: Interview with Mr. G. V. Kozlov, Director of the
Institute of Oil Refining (IOP), Moscow (Ob. Inst. naftopochvostroeniya i naftoobrabotki), The
Institute of Oil Refining (IOP) is one of the leading research centers in the Soviet industry in work in
the development of technologies for the processing of crude oil. The industry is now in
the production of gasoline, kerosene, fuel oil and derivatives of large quantities
of benzene, toluene, xylene, alcohols, fatty acids and derivatives.
The operation should help to increase utilization of the crude but the
production of hydrogen needs to be more efficient by the use of new
methods of treating refinery waters. (I.O.)

PROCESSES AND PROPERTIES INDEX

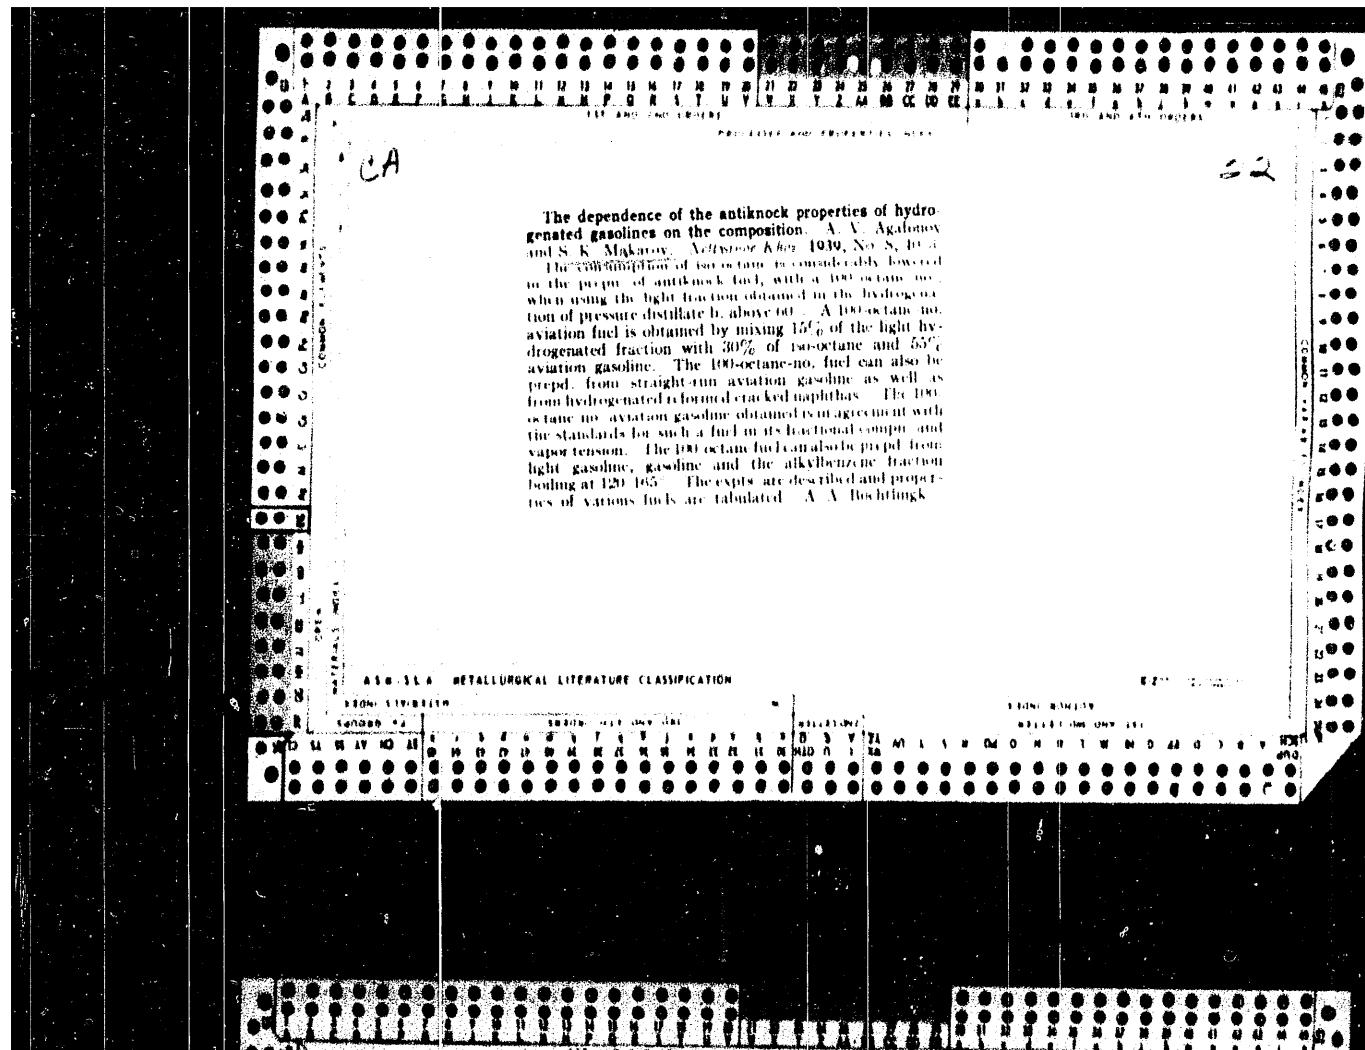

Poisoning of alumina-silica catalyst by water vapor.
 S. K. Makarov and M. A. Kaliko. *Neftegazne Khim.* 25, No. 2, 42 (1947). A Houdry-type alumina-silica catalyst normally capable of producing a 10% yield of gasoline, gave only a 3% yield after storage in open air. The deactivation is due partly to adsorption and capillary condensation of water vapor from the air. In addition, there is also absorption, which takes place at a lower rate than the first-mentioned effect and which decreases with rise in temp. At 500-600° enough absorbed moisture remains in the catalyst to cause subsequent deactivation at higher temps. Exothermic effects exhibited in the absorption and desorption isotherms at 400-600° are apparently due to catalytic action of moisture on the process of recrystallization of the catalyst. The injurious influence of absorption can be prevented by the use of vacuum during the period of thermal "formation" of the catalyst structure, or by removing the residual physically bound moisture from the catalyst by calcining it *in vacuo* at a temp. up to 550-600°.

REFERENCES

Some methods of calculating rolling resistance were developed by Ye. A. Chudakov (Kachanive, 1940) and V. P. Kostylev (1940, AN SSSR, M., 1948). Rolling resistance was related to the load, rolling radius, and rolling velocity. These laws were found to be in close agreement with experimental data obtained under conditions described by N. F. Gerasimov (1940), V. P. Kostylev, and V. P. Kirillov ("Vozdukh i voda v avtomobile", 1960). Rolling resistance depends on dynamic radius and rolling conditions, nearly free rolling, and constrained movement. Between two cylindrical points were measured at an angle of 180° on an oscillogram. Rolling radius and dynamic radius were compared with the corresponding gear parameters. The measurements are summarized, and the results are used to determine the mechanism of the road surface and rolling.

Subject: Theoretical analysis of pneumatic roller rolling along a hard road and deformable ground.

Source: "Avtomobil'naya promstvornost", no. 10, 1964, 22-25.

Abstract: The dependence of dynamic tire radius, road surface material, rolling velocity, and load on the mechanical properties of the rubber and the mechanical characteristics of the road surface are determined. The results of tests of three types of tires (I-240, I-245, and I-246) are presented. The first series of tests was for determining the initial deformation of the tire under several loadings and for determining the dependence of the dynamic tire radius on the mechanical properties of the road surface. Account is made of the stiffness of the rubber and the mechanical properties of the road surface. The second series of tests was for determining the dependence of the dynamic tire radius on the constant velocity of rolling and the load. The third series of tests was for determining the dependence of the dynamic tire radius on the mechanical properties of the road surface. The results of the tests are plotted and compared for the different roller types. The
