TITLE: A method of increasing nickel concentration in an iron-nickel  
alloy

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 10, 1962, 23,  
abstract 10G162P (Polish pat, no. 44838, July 20, 1961)

TEXT: The method consists in conversion of Fe-Ni alloy accompanied by a  
partial slagging of Fe as a result of which the Ni concentration in the alloy  
increases. Air or oxygen blast is used. The converter lining should be preferably  
a basic one. In the process of conversion acid fluxes are added to bind Fe oxides  
being found.

Makowski, Stefan (Lieutenant Colonel, Doctor)

Rocket technology in antiaircraft defense (Technika rakietowa w obronie przeciwlotniczej) [Warsaw] Wyd-wu UW, 1965. 253 p. illus., biblio. (At head of title: Uniwersytet Warszawski. Studium Wojskowe) 620 copies printed.

TOPIC TAGS: air defense missile, antimissile missile, surface to air missile, missile control

PURPOSE AND COVERAGE: The book would be useful to rocketry engineers, rocket troops, and, in higher educational institutions, in rocketry engineering courses. It includes comprehensive analysis of air-defense missiles and their aerodynamic and flight theories. Missile design and construction, combustion systems and engine types, exhaust systems, fuel types, and fuses used in missiles are discussed, as well as the remote-control and guidance systems used in air-defense missiles, radio control, radar applications, aircraft-detection systems, and tracking and homing systems. The missiles are classified according to whether they are used against low, medium, or high flying targets, or whether they are used against such large targets as military concentrations. The latter type of missile is launched from a permanent launching pad. The concluding chapter features a discussion of defense against rockets and the capabilities of the US "Nike-Zeus" and "Nike-X" missiles. Warning systems are also covered, as well as systems to detect missiles while still at a distance from their targets.

621.314.22 : 621.317.33  
4966. The methods of testing measurement trans-  
formers in industrial practice. K. AULEYNIER,  
Z. MAKOWSKI AND J. ZALEWSKI. Przeglad elektrotech.  
11 No. 2-4, 254-6 (1935) in Polish.

The practice shows the ineffectiveness of methods  
of test used during manufacture. The need arises for  
detailed tests on each of the components such as wire,  
insulating materials, lacquers, laminations, etc. The  
laminations must be magnetically homogeneous;  
classification according to their magnetic quality must  
be done by their producer. Transformers in produc-  
tion must be checked for defects of insulation between  
turns, for moisture, de-aeration, etc. Finished trans-  
formers must be tested with a.c. and pulses. The  
test voltage of the prototype transformer must be at  
least 5% higher than for transformers produced after.

AUTHORS: Goliński, Jacek and Makowski, Zbigniew

TITLE: Resonance phenomenon in capacitive voltage transformers

PERIODICAL: Przeglad elektrotechniczny, no. 3, 1962, 99-104

TEXT: The conditions for the occurrence of ferro-resonance in a capacitive voltage transformer and the influence of the transformer elements on the occurrence of harmonics are illustrated by means of vector diagrams for the cases of parallel and series ferro-resonance. The problem of damping of ferro-resonance oscillations is discussed in connection with the existing foreign standards. The program of author's investigations carried out at the Institute of Electrotechnics and described in this paper involved the study of the possibilities of occurrence of ferro-resonance in cases other than those covered by the Swedisch Standards SEN9-1952T § 29, finding the appropriate methods of oscillation damping, and laboratory tests on an unbalanced capacitive voltage transformer during normal working conditions. The method of oscillation damping based on connecting

Card 1/2

Resonance phenomenon in ...

P/021/62/000/003/002/002  
D265/D301

the resistance during unbalance and that based on the use of permanent resistive load are described and illustrated by diagrams. Conclusions are drawn that for high capacitance of the condenser potential divider during the unbalanced load causing the core saturation, ferro-resonance is most likely to occur. Damping is best accomplished by additional loading of the transformer coil. The Swedish standards requirements SEN9 proved to provide a simple and effective test procedure. There are 12 figures and 16 references: 3 Soviet-bloc and 13 non-Soviet-bloc. The 4 most recent references to the English-language publications read as follows: T.T. Norimatsu and H. ORG: Department of Vibrations, IBTP, Polish Academy of Sciences

TITLE: Surface waves in piezoquartz

SOURCE: Proceedings of vibration problems, v. 7, no. 4, 1966, 403-419

TOPIC TAGS: crystal, piezoelectric crystal, quartz crystal, crystal vibration, piezoquartz, surface wave, ultrasonic surface wave, hypersonic surface wave, surface wave amplification, surface wave amplifier, perturbation solution, closed form solution

ABSTRACT: Numerical solutions of the problem of surface-wave propagation in piezoquartz were presented. Surface-wave propagation velocities and damping decrements in the  $x_1$ ,  $x_2$ , and  $x_1$ ,  $x_3$ , planes of the crystal were determined. A closed-form perturbation solution with a simultaneous isotropic approximation of the crystal's elastic properties was also given. The qualitative and quantitative usefulness of such a approximation was evaluated. The present piezoquartz

Card 1/2

ACC NR: AP7003460

surface-wave research, in addition to filling a gap in existing solutions, becomes particularly important in connection with problems of amplifying ultrasonic and hypersonic surface waves in piezoelectric crystals, and especially in piezoquartz. The perturbation solutions make it possible to obtain closed-form solutions for problems of surface-wave amplifiers. Before, however, they must be evaluated and verified with accurate solutions, which was the actual purpose of the present study. Orig. art. has: 2 figures and 98 formulas. Personal exposure indicator

in one holder fitted with lead and copper filters ~~screws~~, while thermal neutrons are measured in another holder with cadmium and tin filters. Agfa D-3 and D-A films are used. The energy of X-rays and gamma radiation is evaluated according to the difference in the blackening of film, with the aid of two copper filters of different thickness, the extent of error being 25%. The dosage of  $\beta$ -rays is indicated by the extent of blackening of the film which lies under the hollow part of the holder. The films were sensitive for up to 1 month and were developed along with the control film which was calibrated with the aid of standard radiation sources. There are 12 figures and 7 references.

AUTHORS: Králik, B., Makray, T., Toth, G.

TITLE: Investigating Al distribution in semi-killed steel ingots and plates

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 2, 1962, 43, abstract 2V26!  
("Dunai vasml", 1960, v. 1, no. 1, 22-32, Hungarian)

TEXT: The author describes a technology for melting and teeming 1.4 -  
3.0-ton semi-killed steel ingots at the Dunai Metallurgical Combine. Final  
deoxidation is performed with Al powder (0.18 - 0.24 kg/t) through a funnel  
prior to completing the filling of the mold. The authors studied the distribu-  
tion of deoxidation products in ingots and plates (8 - 25 mm) by the method of  
radioactive isotopes (with the use of Al tagged with Zn<sup>65</sup>). They investigated  
also topography of plate defects by ultrasonic control to reveal the causes of  
rejects due to surface (15.16%) and internal (13.19%) defects. The non-uniform  
distribution of Al<sub>2</sub>O<sub>3</sub> impurities revealed over the cross section of ingots and  
sheets was about 26% (increasing percentage towards the center) and over the  
height was ~71% (displacement towards the top of the ingots and plates).  
Rejects during the rolling of plates increase on account of a stronger segregation

of  $\text{Al}_2\text{O}_3$  impurities which is accompanied by the formation of cavities, unable to be welded-up, at the ingot top in the case of excessive final deoxidation, and by the formation of internal blisters in the case of weak final deoxidation. The formation of cavities which are unable to be welded-up, is explained by the joint effect of emanating gases and shrinkage. To improve the quality of ingots, it is recommended to use risers and to add the metal after final deoxidation through a funnel during the teeming into molds.

Title : The expansion of the area of the elk.

Periodical : Priroda 44/1, page 119, Jan 1955

Abstract : The prevalent idea that the areas inhabited by the elk are limited to forest lands is refuted by the finding of elk in regions where they were not known to be before, especially in the northern European tundras. It is also noted that elk make seasonal migrations. One USSR reference (1944).

TITLE:

An Apparatus for the Determination of the Depolarization Resistance of Polymers (Pribor dlya opredeleniya depolimerizatsionnoy ustoychivosti polimerov)

PERIODICAL:

Zavodskaya Laboratoriya, '959, Vol 25, Nr 2,  
p 219 (USSR)

ABSTRACT:

Additions of polyisobutylene, vinipol etc dissolved in lubricating oils decompose when heated, thus changing the viscosity of the oil. An apparatus has been designed which makes it possible to test simultaneously 8 oil samples containing such additives. The design is a modification of the standard apparatus by Pinkevich (GOST 5162-49) for the determination of the corrosiveness of oils. Each of the eight test tubes (Fig) containing an oil sample has a spherical cooler and a glass agitator (Fig). The latter is driven by the mechanism of the apparatus. The samples are heated up to a maximum temperature of 220° by an oil bath. The samples are taken by means of a pipet. The reliability of the apparatus described was proven by an experimental operation over
