"Blood Volume Determination in Animal Experiments With a Radioactive Isotope I."

Budapest, Honvédorvos, Vol XV, No 3, July-Sept 1963, pages 234-242.

Abstract: [Authors' Hungarian summary] The blood volume of 40 rabbits has been determined by the use of various radioactive isotope techniques. Some of the tests have been carried out with I^{131} -labelled plasma proteins. The blood volume, calculated from the plasma volume by use of the hematocrit value, was found to be 6.65 ± 0.38 per cent of the body weight. The total volume of erythrocytes has been determined with P^{32} . The blood volume, based on the volume of erythrocytes has been obtained if the blood

TITLE: Role of blood catalase activity in the radiation damage of erythrocytes

33

SOURCE: Magyar radiologiya, no. 5, 1964, 288-293

31

TOPIC TAGS: rabbit, x-ray irradiation, radiation biologic effect, radiology,
blood, radiation damage

Abstract: [Authors' English summary modified] The changes in blood catalase
activity have been investigated in 18 normal rabbits and in 38 rabbits irra-
diated with different doses of X-ray. Determinations were made within the
first hours following irradiation and during the first 10 days. It was found
that the changes in the catalase index remained within normal biological
limits. A slight decrease has only been observed at the preterminal stage.
In the mechanism of radiation damage to erythrocytes, therefore, the catalase
effect and the peroxide

"Study of the Radiation Damage to Erythropoiesis Using an Iron Isotope in Mice. I. ^{59}Fe incorporation Into the Erythrocytes and Storage Organs of Normal and Irradiated Mice."

Budapest, Honvédorvos, Vol XVIII. No 2, Apr-Jun 66, pages 117-126.

Abstract: [Authors' Hungarian summary] In normal mice, a considerable portion of the i.v.-administered, radioactive ^{59}Fe isotope is incorporated into the erythrocytes and appears in the circulation in about 72 hours. The rest of the radioactive iron is taken up mainly by the storage organs - bone marrow, liver and spleen. When the iron isotope is administered 24 hours after irradiation, the extent of erythrocyte labelling is decreased in inverse proportion to the dose used for irradiation although the rate of erythropoiesis both

"Lymphographic Examinations in Thoracic Sarcoidosis."

Budapest, Orvosi Hetilap, Vol 107, No 35, 28 Aug 66, pages 1641-1644.

Abstract: [Authors' Hungarian summary] On 12 patients with histologically confirmed sarcoidosis, the lymphatic system of both lower extremities was filled with a 38 per cent solution of Lipidol U.F. contrast material. It was found that, in addition to the thoracic changes, the majority of patients in the I. and II. clinical stage of the disease showed signs of involvement of the inguinal, pelvic and paraaortic lymph nodes as well. This served as proof of the earlier hypothesis that sarcoidosis is a systemic disease of the lymphoreticular system. Simultaneously with the recovery of the thoracic

"Biopsy Examinations in Sarcoidosis; Inguinal Lymph Node Biopsy."

Budapest, Orvosi Hetilap, Vol 107, No 35, 28 Aug 66, pages 1650-1653.

Abstract: [Authors' Hungarian summary modified] On the basis of lymphographic studies on 12 patients, it was concluded that thoracic sarcoidosis, in the cases observed, represents a partial symptom of a systemic disease in which considerable enlargement of the lymph nodes in the inguinal region can be demonstrated. In 7 cases, biopsy of the superficial lymph nodes of the latter region was performed; a histological finding indicative of sarcoidosis was obtained in 4 cases (mostly from almond to plum-sized nodes). In 5 cases of the disease (not confirmed by lymphography), the routine biopsy from pea-bean sized inguinal nodes was negative while in 3 cases, involving somewhat larger lymph nodes, the possibility of early changes due to sarcoidosis was raised. Biopsy from this region appears to be useful in the presence of rather greatly enlarged lymph nodes. The histological findings in tissue from this region are more reliable from the differential diagnostic aspect (ex-

"Pulmonary Alveolar Proteinosis."

Budapest, Orvosi Hetilap, Vol 108, No 8, 19 Feb 67, pages 347-351.

Abstract: [Authors' Hungarian summary] A literature survey is presented on pulmonary alveolar proteinosis (PAP) followed by the discussion of a case. Clinical and laboratory studies failed to yield a diagnosis. Lung biopsy was performed and the presence of PAP was confirmed by a histological evaluation. Examination of the sputum was also of diagnostic value since, in addition to a PAS-positive, cell-free, granulated material, it also contained bodies of lamellar and granular structure resembling corpus amylocitum. The patient's anamnesis, his occupational history, the symptoms, the clinical appearance of the disease and the histological picture correspond, in all their major characteristics, to pulmonary alveolar proteinosis as described by Rosen et al. All 20 references are listed.

S/044/62/000/006/061/127
B168/B112AUTHOR: Mandi, Petr

TITLE: Spectral theory of semi-groups connected with diffusion processes and its application

PERIODICAL: Referativnyy zhurnal. Matematika, no. 6, 1962, 5, abstract 6V22 (Chekhosl. matem. zh., v. 11, no. 4, 1961, 558-569)

TEXT: Diffusion processes on an interval $(0, \infty)$, for which the Fokker-Planck-Kolmogorov equation has the form

$$\frac{\partial u}{\partial t} = \frac{\partial}{\partial x} \left(\frac{\partial u}{\partial x} - b(x)u \right) = Lu,$$

are examined. It is assumed that ∞ is a natural boundary in Feller's sense, but that the reflecting, elastic, or absorbing screen is situated at zero. The limiting behavior of the probability distribution of this process when $t \rightarrow \infty$, and also that of the conditional distribution at moment t on condition that absorption has not taken place up to this

S/044/62/000/006/061/127

B168/B112

Spectral theory of semi-groups...

particular, the following result was obtained. If

$$\int_0^\infty \exp \left\{ \int_0^x b(s) ds \right\} dx < \infty \quad \text{and} \quad \int_0^\infty \left| \frac{1}{2} b^2(x) + b'(x) \right| dx < \infty,$$

then a limiting probability distribution exists in the case of the reflecting screen when $t \rightarrow \infty$. In the case of the absorbing or the elastic screen the conditional distribution in fact tends to ∞ ; but if

$$\frac{1}{2} b^2(x) + b'(x) \rightarrow \infty, \quad x \rightarrow \infty,$$

then its absolute value tends to the limiting distribution.

TITLE: Isolation of Non-Metallic Inclusions by the Method of
Direct Chlorination and their Identification (Isolace
nekovových vmešťků metodou přímé chlorace a jejich
identifikace)

PERIODICAL: Hutnické Listy, 1959, Nr 7, pp 617-620 (Czechoslovakia)

ABSTRACT: The isolation was effected by the method of direct
chlorination based on the action of purified chlorine
on steel or Fe-Si at temperatures of 450 and 800-850°C.
The identification of the non-metallic inclusions was
effected by colorimetric methods, except for the Si, for
which the determination was by gravimetric methods, and
for calcium, for which the determination was effected
chelatometrically. A description is given of the
instrument used and sketches of the apparatus are
reproduced in Figs 1 and 2. The processes of determina-

TITLE: Spectroscopic Analysis of Non-Metal Inclusions in Steel

PERIODICAL: Hutnické listy, 1960, No. 12, pp. 979-982

TEXT: The composition of non-metallic inclusions in steel throws considerable light on deoxidation processes and the present paper submits a method for quantitative analyses of inclusions by means of spectrophotography.¹⁾ It is based on spectra excitation by means of sparks from rotating carbon electrodes. At first some older methods of spark analysis are discussed. Then a method of quantitative analysis is described which is based on using a solution technique and gives a very much clearer picture about the overall composition of the inclusions. It is a modification of the spark-spectrographic method previously described by Piper et al. (Radex Rundschau, 1957, p. 727). An essential part of the technique

Spectroscopic Analysis of Non-Metal Inclusions in Steel

produce a bead. This is then dissolved in dilute citric acid. The accuracy of the method is dependent upon all inclusion constituents being completely dissolved and kept in solution at least during the sparking-off period. Owing to great variations in the composition of inclusions and owing to great discrepancies in the concentration of the different elements, it is not feasible to select a standard reference sample. Therefore, the authors have adopted the technique of a synthetic standard by adding a solution of cobalt chloride to the solubilised borax bead. The lines of cobalt are in the vicinity of those of the analysed elements but they do not produce interference. Furthermore, cobalt is not present in the inclusions and its salts are soluble on extraction from the borax bead. The solution was placed in a cell from synthetic resin (contents 1 ml) and then subjected to the spark. Absorption spectra were measured by the Ultra-Rapid Photometer of Zeiss Jena and a hydrogen tube was used as standard source of light. The

Spectroscopic Analysis of Non-Metal Inclusions in Steel

Results of spectroscopic analyses by spark were compared with results by microanalysis and showed good overall agreement. Percentage composition of inclusions are tabulated. The maximum error of the spark analysis varies from 5 to 6%. Advantages of the method are as follows:

- 1) The total analysis can be carried out after a single weighing out of the sample. No preliminary separation of single components is required.
- 2) The presence of individual elements can be established from the spectrum qualitatively prior to quantitative analysis.
- 3) Weighed-out quantities are very small, permitting several analyses from one starting material.
- 4) Greater sensitivity of method.
- 5) Considerably shortened time required for analysis.

TITLE: Contribution to the separation and determination of sulfide occlusions in steel

SOURCE: Hutnické listy, no. 8, 1964, 520-534

TOPIC TAGS: steel, sulfide, metal property, electrolysis, spectrographic analysis

ABSTRACT: The authors review and evaluate the methods of separation of sulfide occlusions from steel, and discuss their influence upon the mechanical and other properties of steel. As a result of the evaluation the authors established a new method for electrolytic separation of the sulfide occlusions, and a method for their determination by spectrography. They described their method that allows a spectrographic analysis of the content of Fe, Mn, Al, Ca, Mg, Ti, and V in an alcoholic iodine.

B

AUTHOR: Mandl, Petr (Candidate of sciences)

TITLE: Optimal control of a one-dimensional diffusion process

SOURCE: Aplikace matematiky, v. 9, no. 6, 1964, 412-420

TOPIC TAGS: optimal automatic control, applied mathematics

ABSTRACT: This article deals with homogeneous one-dimensional diffusion processes in the interval $\langle r_0, r_1 \rangle$, the coefficient of local displacement and the diffusion coefficient of which depend on the parameter y . The behavior of the process when the boundaries are reached is determined by conditions (1):

$$\partial_n u(r_0) - \sigma_0 u(r_0) = r_0 \int_{r_0}^1 u(x) d\mu_0(x) + \kappa_0 u'(r_0), \quad (1)$$

$$\partial_n u(r_1) - \sigma_1 u(r_1) = r_1 \int_{r_0}^{r_1} u(x) d\mu_1(x) - \kappa_1 u'(r_1).$$

L 57420-55

ACCESSION NR: AP5019310

The problem consists in selecting the value $\eta(x)$ of the parameter y as a function of the value x of the process in such a way as to maximize (3):

$$c(x; \eta) = \int_0^x \int_{\tau_0}^t P_\eta(t, x; ds) c(s, \eta(s)) dt. \quad (3)$$

The maximum of (3) satisfies equation (5):

$$\frac{d^2}{dx^2} c + \max \left[h(x, y) a(x, y)^{-1} \frac{d}{dx} u + r(x, y) a(x, y)^{-1} \right] = 0 \quad (5)$$

with conditions (1). One of the optimum controls is set by means of (19):

$$y_-(x) = \min \{ y : \beta(x, y) u(x, y_0) + \varphi(x, y) = -\Phi(x, u(x, y_0)) \} \quad (19)$$

TITLE: Applications of the theory of the optimal control of continuous diffusion processes

SOURCE: Kybernetika, v. 1, no. 1, 1965, 28-36

TOPIC TAGS: optimal control, automatic control theory, automatic control R and D, random process

ABSTRACT: This paper presents specific examples of the application of the theory of the optimal control of continuous diffusion processes previously developed by the author. One-dimensional continuous homogeneous diffusion processes are considered as a random process $X(t)$, within a finite interval $I = [t_0, t_1]$ defined by the solution to the following differential equation:

$$dX(t) = \mu(t)dt + \sigma(t)dW(t)$$

L 00C94-66

ACCESSION NR: AP5013484

terminate or be resumed from a suitable point within the interval given by its probability density. The control of a process is based on selecting suitable coefficients a and b as a function of I . The control of fluid flow through a reservoir by pumping, and the control of the addition of a nutrient to a culture of microorganisms are considered. In both cases the costs associated with the quantity $X(t)$, which depend partly on the course of $X(t)$ within I and partly on the resumption of the process $X(t)$ after reaching one of the interval limits, are considered. The object of control is to minimize the average cost per unit time. For comparison a case is also discussed where the process $X(t)$ ceases after reaching one of the limits. Orig. art. has: 1 figure and 51 formulas.

Production Planning and Quality Control in Foundries
A. Mandoki. (Untold, 1960, vol. 1, May, pp. 97-108;
Bonytszai és Kohászati Lapok, 1966, vol. 5, May). [In
Hungarian]. The problems of production planning and
quality control in Hungarian foundries are reviewed. In the
discussion J. Dsula mentioned that about 60% of casting
rejects are due to minor types of negligence which are difficult
to deal with because the available experts are fully occupied
with eliminating production bottlenecks. These rejects
would be eliminated by establishing independent and satis-
factory quality control and by stopping skilled foundrymen
doing unskilled work--A. G.
