TITLE: An Investigation by Optical Polarization of the Flow Processes in Concentrated Solutions of High Polymers (Polyarizatsionno -opticheskoye issledovaniye protsessov techeniya kontsentrirvannykh rastvorov vysokopolimerov)

PERIODICAL: Zhurnal Tekhnicheskoy Fiziki, 1958, Vol.28, Nr 2, pp.279-286 (USSR)

ABSTRACT: The peculiarities of the viscosity-, thixotropic- and dynamo-optical properties of a concentrated solution of ethylcellulose were compared here. The results in the determination of the extinction angle and the angles at double refraction well explain the nature of the thixotropic transformations in solutions of ethylcellulose. The quantitative dependence of the quantities of the double refraction and the extinction angles on the shearing strain and the velocity gradients is determined here. On the basis of a comparison of the rheological and the dynamo-optical characteristics of systems which were investigated in a rotation-device with coaxial cylinders and a homogeneous poten-

An Investigation by Optical Polarization of the Flow Processes in Concentrated Solutions of High Polymers

tial field, a method for the determination of the kinematics and the dynamics of the flows of anomalous viscous systems with a heterogeneous potential field is suggested here. For the case of a plane flow with a heterogeneous potential field the authors show a good convergence in the calculation of the kinematic and dynamic flow cross sections which were performed on the basis of the rheological and polarization-optical measurements. There are 6 figures, and 7 references, 6 of which are Slavic.

TITLE: Assembly for complex estimating the strength of flanged couplings. Class 42, No. 179984 /announced by Military Academy of Chemical Defense (Voyennaya akademiya khimicheskoy zashchity) 17

SOURCE: Izobreteniya, promyshlennyye obratzay, tovarnyye znaki, no. 6, 1966, 96

TOPIC TAGS: metal joining, mechanical power transmission device, pressure gage, visual signal, signal element

ABSTRACT: This Author Certificate presents an assembly for complex estimating of the strength of flanged couplings. The assembly contains a hydraulic press for loading the flanged coupling and instruments for determining the compression stress in the flanged joint (see Fig. 1). To determine more exactly the penetration of the working liquid between the contact surfaces of the flanged coupling, one half of the contact surface of the flanged coupling carries uniformly distributed electrical gauges. Each of these gauges is connected to a signaling device such as

SUBJECT USSR/MATHEMATICS/Number theory      CARD 1/2      PG - 552  
 AUTHOR MANIN Ju.I.  
 TITLE On congruences of third degree with respect to a prime modulus.  
 PERIODICAL Izvestija Akad.Nauk 20, 673-678 (1956)  
 reviewed 1/1957

The author gives an elementary proof for the estimation (Hasse)

$$|N_p - p| < 2\sqrt{p}$$

of the number  $N_p$  of solutions of the congruence  $y^2 \equiv x^3 + ax + b \pmod{p}$ ,

$p$  - prime number  $> 3$ ,  $4a^3 - 27b^2 \not\equiv 0$ . The author states that to every two solutions  $(x_1, y_1)$  and  $(x_2, y_2)$  there corresponds a further solution  $(x_3, y_3)$  (third intersection point of the secant through  $(x_1, y_1)$  and  $(x_2, y_2)$  with the curve  $y^2 = x^3 + ax + b$ ). Then a twosided infinite sequence is defined:

$$X_0 = x^p, \quad Y_0 = (x^3 + ax + b)^{\frac{p-1}{2}}$$

$$X_{n+1} = -x - X_n + \frac{(1-Y_n)^2}{(x-X_n)^2} (x^3 + ax + b)$$

Izvestija Akad.Nauk 20, 673-678 (1956)

CARD 2/2

PG - 552

$$Y_{n+1} = \frac{1-Y_n}{x-X_n} (x - X_{n+1}) - 1$$

for  $n > 0$  and  $(X_n, Y_n) \neq (x, \pm 1)$ . Similar definition formulas are given for  $n > 0$  and  $(X_n, Y_n) = (x, 1)$  and for  $n < 0$ . It is asserted that for all  $n$  for which  $X_n$  is defined, the degree of the numerator of  $X_n$  in  $x$  is greater than the degree of the denominator. Now let

$$d_n = \begin{cases} 0 & \text{if } X_n \text{ is not defined} \\ \text{degree of the nominator of } X_n & \text{in all other cases.} \end{cases}$$

For  $d_n$  the following lemmas are proved wherefrom the estimation follows immediately:

$$1. \quad d_{n-1} + d_{n+1} = 2d_n + 2$$

$$2. \quad d_n = n^2 - (d_{-1} - d_0 - 1)n + d_0$$

$$3. \quad d_{-1} - d_0 - 1 = N_p - p.$$

TITLE:

Algebraic Curves Over Fields With Differentiation (Algebraicheskiye krivyye nad pol'yami s differentsirovaniyem)

PERIODICAL:

Izvestiya Akademii nauk SSSR, Seriya matematicheskaya, 1958, Vol 22, Nr 6, pp 737 - 756 (USSR)

ABSTRACT:

The author considers the group of the divisor classes of the degree zero of a curve which is defined over a field of constants with differentiation and the additive group of a vector space of finite dimension over the field of constants. A differential-algebraic homomorphism of the group of the divisor classes into the additive group of the vector space is constructed. The investigation of the homomorphism kernel proves to be very difficult already in simplest cases. As an application of the general theory the author gives a criterion for the linear dependence of the points of an elliptic curve over the field of the rational functions. He essentially uses a lemma of Chevalley [Ref 2]. The author thanks I.R. Shafarevich for his interest in the present paper. There are 5 non-Soviet references, 3 of which are American,

TITLE: On the Moduli of a Field of Algebraic Functions (O modulyakh polya algebraicheskikh funktsiy)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 3, pp 488-491 (USSR)

ABSTRACT: The author proves the conjecture of Teichmüller [Ref 2,4]. Here the hyperelliptic case already investigated by Eichler [Ref 3] is excluded. The proof of the author is based on rather general considerations of the independent parameters (moduli) of a field of algebraic functions with the characteristic zero. The consideration starts from the investigation of the author [Ref 1] concerning the differentiation in the constant field. The author thanks I.R. Shafarevich who directed him to the possibility of proving the conjecture of Teichmüller in the mentioned way.

TITLE: On the matrix of Hasse-Witt of an algebraic curve

PERIODICAL: Akademi nauk SSSR. Izvestiya. Seriya matematicheskaya,  
v.25, no.1, 1961, 153-172

TEXT: The author calculates the characteristic polynomial of the matrix of Hasse-Witt and some other matrices connected with it. It is shown that the rows of the matrix of Hasse-Witt are solutions of the classical system of equations of periods.

Let  $K$  be a field of the finite characteristic  $p$ ; let  $\Gamma$  be a curve of the genus  $g > 0$  defined over  $k$ ; let  $\Gamma$  be not singular and complete; let  $R_k(\Gamma)$  be the field of rational functions on  $\Gamma$  defined over  $k$ . Let  $P_1, \dots, P_g$  be  $k$ -rational points on  $\Gamma$ ; let the divisor  $\sum_{i=1}^g P_i$  be non special. Let

$t_i \in R_k(\Gamma)$  be a local uniformizing variable at  $P_i$ . The repartition  $r_i$  of  $R_k(\Gamma)$  be defined in the sense of Chevalley by putting  $(r_i)_P = \frac{1}{t_i}$

for  $P = P_i$  and  $(r_i)_P = 0$  in the other cases. Let  $\hat{\mathcal{A}}(D)$  be the space of the

Card 1/4

S/038/61/025/001/003/003  
C111/C222

On the matrix of Hasse-Witt...

repartitions which are multiples of the divisor  $D$ . Then  $r_1, \dots, r_g$  form a base of the  $k$ -vector space  $\mathcal{O}/(\mathcal{O}(0)+R_k(\Gamma))$  since  $\sum_{i=1}^g$  is not special. ✓

Especially it holds

$$r_i^p \equiv \sum_{j=1}^g a_{ij} r_j \pmod{\mathcal{O}(0)+R_k(\Gamma)},$$

where  $A = (a_{ij})$  is the so-called matrix of Hasse-Witt with elements of  $k$ .

The following properties of  $A$  are found:

1°. If the non-special system of points  $(P_1)$  is replaced by another such system and the local uniformizing variables  $(t_1)$  are also replaced by another system then  $A$  is transformed according to the law

$$A \rightarrow S^{-1}AS^{(p)},$$

where  $S$  is a non-degenerated  $(g, g)$ -matrix with elements of  $k$ , and the elements of  $S^{(p)}$  are the  $p$ -th powers of the corresponding elements of  $S$ .  
Card 2/4

88293

S/038/61/025/001/003/003  
C111/C222

On the matrix of Hasse-Witt...

2°. If the  $k$  is algebraically closed then the cyclic unramified extensions of  $p$ -th degree of  $R_k(\Gamma)$  are in a one-to-one correspondence with the base elements of a linear space consisting of vectors  $\bar{c}$  for which  $\bar{c}^{(p)} A = \bar{c}$ .

The dimension of this linear space equals the rank of the matrix  $AA^{(p)} \dots A^{(p^{g-1})}$ .

Theorem 1: Let the curve  $\Gamma$  with the genus  $g > 0$  be defined over the field  $k_0$  of the characteristic  $p \neq 0$  consisting of  $q = p^a$  elements. On  $\Gamma$  let exist a non-special system of  $g$   $k$ -rational points. Because of the property 1° the matrix  $A$  of Hasse-Witt of the curve  $\Gamma$  is defined uniquely up to transformation  $A \rightarrow S^{-1}AS^{(p)}$ , where  $S$  is a non-degenerated matrix with elements of  $k$  so that the characteristic polynomial  $|A_\pi - \lambda E|$  of the matrix  $A_\pi = AA^{(p)} \dots A^{(p^{a-1})}$  is an absolute invariant of  $\Gamma$ . It holds

$\bar{\pi}(\lambda) = (-1)^g \lambda^g |A_\pi - \lambda E|$ , where  $\bar{\pi}(\lambda)$  is the characteristic polynomial reduced mod  $p$  of the endomorphism  $\pi: (x) \rightarrow (x^q)$  of the Jacobian  $J$  of the curve  $\Gamma$ .

Theorem 2 asserts that the rows of the matrix of Hasse-Witt satisfy

Card 3/4

every differential relation which is satisfied by the base elements of the space of differentials of first kind mod the space of complete differentials.

Results by Serre and Cartier are used essentially for the proof of the theorems.

The author thanks I.R.Shafarevich for the leading of the work. There are 1 Soviet-bloc and 16 non-Soviet-bloc references. TITLE: Inclusion and Distribution of Methionine S<sup>35</sup> in the Brain of  
White Rats (Vklucheniye i raspredeleniye metionina S<sup>35</sup> v  
golovnom mozge belykh kryss)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 122, Nr 3, pp 504-507  
(USSR)

ABSTRACT: According to present concepts the inclusion activity of the  
marked amino acids in the tissue and the organs reflects the  
autoradiography of the tissue proteins (Refs 1,3). Autoradio-  
graphy makes it possible to establish a relation between the  
inclusion activity of an isotope and certain morphological  
structures, and it gives an accurate characteristic of the  
transformation process not only in the organs and the tissues  
but also in the cells. In the present paper the author aims  
at investigating the dynamics of the protein metabolism in the  
individual sections and nerve cells given in the title. This  
investigation was carried out in newly born 5, 10, 30 days old,  
and in fully grown rats. Nine test series with 90 animals were  
made. They were injected methionine S<sup>35</sup> in indicator doses of

Card 1/3

SOV/20-122-3-50/57

Inclusion and Distribution of Methionine S<sup>35</sup> in the Brain of White Rats

0,5 $\mu$  Ci per 1 g of weight each. The animals were killed by decapitation at different moments after the injection (1 hour to 30 days). The radio-autograms were taken on a liquid emulsion of the type P. The unequal inclusion of S<sup>35</sup> in the different brain sections found is maintained also within the range of the nerve cells in one single layer. The curves given (Fig 2) characterize the differences of the inclusion and the separation of S<sup>35</sup> in the cerebral cortex, in the cerebellum and in the white matter. A comparison of the inclusion intensity during the accumulation period, during the maximum, and towards the end of the experiment (30th day) is shown in table 1. From the analysis of the numerical data of the isotopic distribution in individual brain sections at later moments may be seen that the dynamics of separation is slow. This points to an unequal character of metabolism as found in the early stages. The unequal character of the methionine distribution in the brain of fully grown rats found is valid for all age groups. It reflects the intensity dynamics of the protein metabolism as well as the functional activity of different structures of the brain. There are 3 figures, 1 table, and 4 references, 3 of which are Soviet.

On the Dynamics of Inclusion and Distribution of Radioactive Phosphorus  $P^{32}$  in the Tissue of the Nervous System of White Rats (Dinamika vklyucheniya i raspredeleniya radioaktivnogo fosfora  $P^{32}$  v tkani nervnoy sistemy belykh kryss)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 4, pp 867 - 869 (USSR)

ABSTRACT:

Phosphorylation processes play an important part in the development and the vital action of the organism. The assimilation of inorganic phosphorus which is accompanied by energy producing processes of respiration and glycolysis forms the basis of the processes of synthesis and formation of biological structures (Refs 1-3). The functional state of the nerve cells is in close relation with the phosphatide metabolism (Refs 4, 5). The morphological analysis of these processes was not yet carried out. Only by the application of  $P^{32}$  the process of assimilation of phosphorus and its rate of reproduction could be determined (Refs 6,7). The author used embryos, 10 days old,

Card 1/4

Nervous System of White Rats

SOV/20-126-4-49/62

and grown-up rats. Each series was hypodermically injected  $7 \mu C$  each, per 1 g weight. The animals were killed at different times between 24 and 240 hours after the injection with  $P^{32}$  by decollation. The inclusion of  $P^{32}$  in the brain of animals of different age is demonstrated by tables 1 and 2. Figure 1 shows the comparative intensity of inclusion in the case of 10 days old rats which were killed at different times. Figure 2 shows the intensity curve of the mentioned inclusion. It may be seen from the results of the autoradiographic investigation that the inclusion of  $P^{32}$  in the cells of the central nervous system is a gradual and slow process. The maximum intensity of inclusion is attained at about the 200th hour, the white substance exclusive. This substance absorbs  $P^{32}$  more slowly. In this case the intensity of inclusion still increased at the 240th hour. The dynamics of inclusion and distribution is similar in young and grown-up animals. The distribution of the marking phosphorus in the different sections of

Card 2/4

SOV/20-126-4-49/62

the central nervous system differs with the individual animals: the differences express the different character of the metabolism in these animals. The intensity of inclusion increases with the growth of the embryo and attains its maximum in the new-born animal. Then it decreases again. The tissue of the central nervous system of 10 days old rats absorbs  $P^{32}$  more intensively than that of grown-up animals. Thus, the intensity of the  $P^{32}$  inclusion and therefore also phosphorus metabolism in the neurons and in the different sections of the central nervous system is not equal and depends on the functional role and the state of the nerve cells. There are 2 figures, 2 tables, and 15 references, 10 of which are Soviet.

TOPIC TAGS: biology, medicine, nuclear engineering, radiation injury, central nervous system

PURPOSE AND COVERAGE: This book is intended for radiobiologists, pathomorphologists, embryologists, and clinicians. It cites the results of experiments on the effect of various forms of penetrating radiation on the central nervous system of certain mammals (mice, rabbits, guinea pigs, and other animals). The apparent features of the radiosensitivity of the central nervous system of animals are clarified. There is a detailed treatment of the dynamics of the recuperation process after radiation damage and regeneration of the central nervous system of animals.

 V Viscometry of some linear polyesters. Zdeněk Zámorský, Otakar Baroš, and František Maniš (VÚCPT, Gottwaldov, Czech.). *Chem. průmysl* 9, 332-4 (1959).  
 The viscometric behavior was studied of solns. of cryst. polyesters from *p*-hydroxybenzoic acid (I) in phenol (II) + 1,1,2,2-tetrachloroethylene (III) (1:3) and from ethylene-glycol (IV) and dehydromucic acid (V) in [II + III (1:3 and 1:1) or in tricresol. At 30° the degradation of polyesters in soln. was negligible up to 10 hrs. and increased with increasing content of the aromatic compd. in the solvent; the value of  $\eta_{sp}$  was independent of the shear rate. From the slope of  $\eta_{sp}/c = f(c)$  the Huggins const.  $k'$  was detd.; for polyesters from I in II + III (1:3)  $k' = 0.283-0.207$ , for polyesters from IV + V  $k' = 0.331-0.344$ . The value of  $k'$  being independent of mol. wt., the intrinsic viscosity,  $[\eta]$ , can be calcd. from a single measurement of  $\eta_{sp}$ . With increasing temp. the value of  $[\eta]$  for polymers from I decreases; this indicates that II + III (1:3) is a good solvent.

AUTHORS: Kichkin, G. I; Manishevskiy, V. G. and Rubinshteyn, I. A. SOV/65-58-8-3/14

TITLE: Influence of the Chemical Composition of Lubricating Oils on Their Viscosity (Vliyaniye khimicheskogo sostava smazochnykh masel na ikh vyazkostnyye svoystva).

PERIODICAL: Khimiya i Tekhnologiya Topliv i Masel, 1958, Nr.8. pp. 15 - 20. (USSR).

ABSTRACT: One of the most important parameters during the determination of the useful properties of lubricating oils is the viscosity and its dependence on the temperature. It is mainly determined by defining its influence on friction and wear of the lubricated surfaces. The authors investigated two residual oils with a viscosity of 16 cps at 100°C (MT-16). One of these oils was prepared from sulphur-containing petroleum and the other from ~~Emba~~ petroleum. The viscosity between 50° - 100° was tested in a standard capillary viscosimeter and at temperatures of 20° and -40°C in a rotation viscosimeter constructed by V. P. Pavlov (Ref.1). The physico-chemical properties of the investigated oils are given in Table 1. It was found that the viscosity of the oil MT-16 from sulphur petroleum, at -40°C, was 1.6 times lower than for the oil MT-16 obtained from

Card 1/4

Influence of the Chemical Composition of Lubricating Oils on Their Viscosity. SOV/65-59-3-3/14

Emba petroleum (Fig.1). The oils were deresinified by absorption on silica gel, and their viscosity determined within the previously defined temperature limits. It was found that the removal of the resinous substances lowered the viscosity by approximately 2 cps at 100°C: from 16.5 to 14.83 for the oil from the S-petroleum and from 16.4 to 14.4 cps for the oil from Emba petroleum. Fig.2: viscosity temperature curves of the deresinified oils. An analysis of the data given in Fig.3 (dependence of the viscosity on the temperature for naphthenic hydrocarbons) shows that the anomaly in the viscosity for naphthenic hydrocarbons separated from the oil MT-16 from S-petroleum occurs in a wider temperature interval than for analogous hydrocarbons of the MT-16 Emba oil. The degree of structure disintegration is three times larger for the S-petroleum oil than for the Emba oil (3.98 as against 1.37). Values in Table 2 (the viscosities of fractions of naphthenic and aromatic hydrocarbons) indicate that aromatic hydrocarbons have a higher degree of viscosity than naphthenic hydrocarbons, and also that the chemical composition of the oil from S-petroleum is more satisfactory with regard to its viscosity-temperature

Card 2/4

Influence of the Chemical Composition of Lubricating Oils in Their Viscosity.

SOV/65-59-9-3/14

properties than the **Emba** oil. It can, therefore, be seen that sulphur compounds increase the degree of viscosity of the aromatic hydrocarbons and consequently that of the oil itself. After the removal of the sulphur compounds the viscosity of the aromatic hydrocarbons decreases at 100°C by 2.7 cps (from 20.8 to 18.1 cps). At practically identical molecular weight the naphthenic hydrocarbons of the **S-oil** differ from the naphthenes of the **Emba** oil by their lower viscosity and larger anomaly in their viscosity. This is due to the fact that the separation of the sulphur compounds lowers the concentration of polycyclic aromatic hydrocarbons. It was confirmed that the naphthenic and mono-cyclic aromatic hydrocarbons are the "carriers" of the anomaly in the viscosity of the lubricating oils, and that the polycyclic aromatic hydrocarbons do not influence the above-mentioned anomaly.

Card 3/4

Influence of the Chemical Composition of Lubricating Oils on Their Viscosity. <sup>SOV/65-53-9-3/14</sup>

This anomaly occurs in a defined temperature interval which is characteristic for each type of oil. There are 2 Tables, 4 Figures and 4 Soviet References.

TITLE: Influence of the number of revolutions and the compression ratio on the volumetric efficiency in one-stage compressors

SOURCE: Constructia de masini, no. 10, 1964, 552-557

TOPIC TAGS: compressor design, propulsion engineering

ABSTRACT: [Authors' English summary modified]: The authors devise a characteristic equation connecting the number of revolutions per minute with the compression ratio of compressors and calculate the coefficients for a number of typical values. Experimental results agree well with the calculated values (with the experimental curve lying somewhat above the theoretical one) so that the method may be used to select optimal parameters in the design of compressors. Orig. Art. Incl. 1 figure, 28 formulas, 6 graphs, and 4 tables.

A basic amplifier for the process control equipment

PERIODICAL:

Archiwum automatyki i telemekhaniki, v. 7, no. 1-2,  
1962, 231 - 241

TEXT: The magnetic transistor-amplifier consisting of a magnetic sumator, pulse width modulator and a switching transistor designed for the new Polish process control unit of the PID type is described. A diagram is given for which the experimental control and load characteristics are provided. Static and dynamic properties are included. Simplicity of construction, reliability of operation and adaptability for other systems such as summation and amplification of two signals, galvanic separation and d.c. current to voltage conversion have thus been achieved. There are 8 figures and 1 table.

2087. MANITIUS A. Dept. of Biochem., Sch. of Med., Gdańsk. \*Potassium content in the blood serum of healthy man BULL. ACAD. POLON. SCI. 1955, 3/5 (159-161)

A method of obtaining serum for K determinations which prevents an outflow of K ions into plasma is described. The blood is centrifuged immediately after collection in tubes coated with a thin layer of solid paraffin. On the 41 sera obtained in this way from subjectively healthy persons of both sexes aged 16-30 yr., K determinations were made simultaneously by Barry-Rowland's colorimeter method and by flame photometry. The mean normal K level in serum is given as 4.25 mEq./l. with a standard deviation of 0.25 mEq./l. No essential sex or age differences in K level were observed.

MANITIUS, A.

Med 498. Potassium/calcium ratio in blood serum of healthy subjects.  
R. Niamiro and A. Maritius *Bull. Acad. polon. Sci.*, 1956, 4: 203-  
205 (Dept. of Physiol. Chem., Sch. of Med., Gdansk, Poland).—The  
results of the determinations of the K/Ca and K/diffusible Ca ratios  
in the blood of 30 persons are shown in tabular form. The variation  
in the results for K/diffusible Ca ratio from 2.25 to 3.40 do not justify  
any conclusion. P. Hias
