TITLE: Experiments on the Resistance to Corrosion<sup>6</sup> of Aluminum and Duralumin<sup>1</sup>

PERIODICAL: Metalurgia și Construcția de Mașini, 1960, Nr 2,  
pp 112-115

ABSTRACT: The authors subjected some samples of commercial aluminum and duralumin cut from sheet metal to laboratory treatment with saline solutions and others to the influence of sea water. The first group of samples was treated in the laboratory of Institutul Politehnic (Polytechnical Institute) in Galați, the second in the Black Sea near Costinești beach. Both series of experiments were carried out between 21 Jun and 25 Sep 1958. Unprotected and protected samples, the latter treated against corrosion by anodic oxidation, were used; one series of samples was exposed to the electro-

Experiments on the Resistance to Corrosion of Aluminum and Duralumin

lytic bath with sulfuric acid and another series to the electrolytic bath with oxalic acid. The authors describe briefly the preparation of the experiments and the results achieved. They state: a) that the aluminum samples resisted corrosion better than the duralumin ones; b) that the samples which were not in contact with other metals resisted corrosion better than others, the aluminum samples not being affected at all in such cases; c) corrosion was worst - electrolytic corrosion - when brass, was used. Even the anodically oxidized samples were affected; d) protection by anodic oxidation is not efficient if the oxide pellicle shows perforations, scratches, impurities, etc.; e) in the case of duralumin anodic oxidation by anodizing processing gave better results in some cases. In conclusion the authors establish

Card 2/3

Experiments on the Resistance to Corrosion of Aluminum and Duralumin

that contact of aluminum or its alloys with copper alloys or iron alloys should be avoided and they should be insulated to preclude electro-corrosion. If contact cannot be avoided the contacting surfaces should be smoothed and finished to prevent the water from penetrating the interstices. Insulation might also be achieved by coating the metal with paint. The surface of pieces anodically oxidized should have no scratches or chinks, not even superficial ones. There are 4 sets of photos, 2 tables, 1 figure and 4 references, 3 of which French and 1 Rumanian.

TITLE: On the corrosion of aluminum and its alloys

PERIODICAL: Metalurgia si constructia de masini, no. 11, 1961,  
937-950

TEXT: The article presents the results of experiments by the authors on the corrosion of aluminum and aluminum-alloy sheets in the various conditions of the Galati and Constanta harbors. The authors used in their experiments commercial aluminum of the following composition: 0.05% Fe, 0.31% Zn, 0.03% Mg, and the rest aluminum, as well as aluminum alloyed with 5% Cu and 3% Zn. Commercial aluminum was rolled into 1.5 - 2 mm thick sheets, while aluminum alloy into 4 - 6 mm thick sheets. The following

Card 1/5

On the corrosion ...

R/009/61/000/011/001/001  
D282/D303

corrosion media were selected: (1) Danube water; (2) Danube atmosphere; (3) Black Sea water; (4) Black Sea atmosphere; (5) town atmosphere of Galati; and (6) Sea water brought into the laboratory. Since in ship or harbor constructions the aluminum generally comes into contact with other materials, the authors selected the following contact hypotheses: (1) without any contact to other material; (2) in contact with OL 38 steel; (3) in contact with copper; (4) in contact with bronze mixed with tin; (5) in contact with fir-wood; (6) in contact with zinc; and (7) in contact with oak-wood. The samples were tested with or without protection, i.e. (1) without any protection; (2) anodically oxidized; (3) painted, and (4) anodically oxidized and painted. The results obtained by the authors completely verified the modern corrosion theories. Thus, in case of commercial aluminum, an anodic dissolution was produced on the samples. This anodic dissolution was increasingly reduced due to a passivity process. In case of samples made from aluminum alloyed with Cu and Zn, the corrosion velocity permanently increased due to the action of

Card 2/5

R/009/61/000/011/001/001  
D282/D303

On the corrosion ...

the cathodic inclosures. A general passivity of the metal or alloy is only produced if there are some conditions of an anodic passivity of the anodic components. Knowing the appearance mechanism of the anodic passivity, the potential up to which the anode has to be polarized, can be calculated. Preliminarily oxidated aluminum samples were more electronegative; the potentials tended towards a stability, i.e. passivity; and the dissolution current had an increasing tendency. In case of aluminum samples alloyed with Cu and Zn, the potential and the current had a continuously increasing tendency. The powerful corrosion of the alloyed samples which in some cases even led to pitting, was especially due to an increase of the number and size of the cathodic inclosures. The corrosion of the commercial aluminum samples was characterized by a surface corrosion, while that of the aluminum-alloy samples by an intercrystalline corrosion. The most powerful corrosion effect on commercial aluminum samples was exerted by Black-Sea-water, while on aluminum alloy samples

✓

Card 3/5

R/009/61/000/011/001/001  
D282/D303

On the corrosion ...

by Black-Sea and Danube waters. The average corrosion depths in the case of commercial aluminum samples was  $60\mu$ , while in case of aluminum alloy samples it was almost 0.5 mm. However, the corrosion process did not vary proportionally with the time. The corrosion velocity increased the longer the aluminum alloy samples were kept in the corroding media, and decreased the longer the commercial aluminum samples were subjected to the activity of the corroding media. The authors draw the following preliminary conclusions: (a) Commercial aluminum is less corroded than aluminum alloyed with Cu and Zn. (b) The most powerful corrosion is produced by Black-Sea water, followed by Danube water. Sea water in the laboratory produced corrosion similar to corrossions produced by the sea-atmosphere. (c) Protecting layers have only delayed the corrosion of all samples submerged in natural waters, but proved to be more efficient in the case of samples subjected to atmospheric corrosion. (d) Generally, the contact materials increased the corrosion effects

Card 4/5

R/009/61/000/011/001/001  
D282/D303

On the corrosion ...

on the samples. (e) Most powerful corrosions were found on samples in contact with copper and bronze. (f) The decreasing order of the influence of the contact material on aluminum and aluminum-alloy samples, independently of the corroding media, was: copper, bronze, fir-wood, oak-wood, steel and zinc. (g) Zinc delayed the corrosion of aluminum and aluminum-alloys. The corrosion of all samples in the atmosphere was generally weak, superficial and uniform, being more powerful under a contact material. Red-lead proved to be a good protecting layer. Anodically oxidized and painted samples were not at all corroded, while painted samples were slightly corroded especially when being in contact with copper and bronze. There are 21 figures, 5 tables and 15 references: 11 Soviet-bloc and 4 non-Soviet-bloc. The reference to the English-language publication reads as follows: J. Sundarjan and T.L. Rama Char: "Inhibition of the Corrosion of Aluminum in Alkaline Solutions", Corrosion prevention and Control, 5, 1958, no. 5, 55-56.

RUMANIA

TOMESCU, V., Lect, Dr, BALASIU, P., Dr, MUNTEANU, Ruxandra, Dr, BARBONTA, P., Veterinarian, and MANOLESCU, Alexandrina, of the Faculty of Veterinary Medicine (Facultatea de Medicina Veterinara) Timisoara.

"On Diseases Transmissible Through Water and Notes on the Sanitation of Water Sources Intended for Animals in Several Units in Banat and Crisana Regiunes."

Bucharest, Revista de Zootehnice si Medicina Veterinara, Vol 16, No 4, Apr 66, pp 38-46.

Abstract: After stressing the importance of potable water sources to prevent the transmission of a number of diseases and reviewing the Rumanian standards for water purification, the authors briefly describe the types of installations used for water purification in the state farms of Banat and Crisana Regiune. Some specific installations, either operating or in the planning stage, are also described.

Includes 3 figures and 12 references, of which 3 German, one French and 8 Rumanian.

Orig Pub : Probl. terap., 1957, 8, 85-91

Abstract : It was shown that largactil or phenergan, introduced to rats in a dosage of 20 mg/kg each, intraperitoneally 10 min. before irradiation with a lethal dose of X-Rays (1000r), lower the death rate of the animals (by estimate 35 days after irradiation) from 89 to 50%. -- From the author's resume.

"The Curarizing Action of Some New Radioprotective Substances."

Bucharest, Revista Sanitara Militara, Vol 62, No 5, Sep-Oct 66,  
pp 861-865.

Abstract: The authors found clear evidence of curarizing activity  
in six radioprotective substances by in vitro studies. The  
substances tested were: phenacyloxime-2-mercaptoethyl dimethyl-  
ammonium bromide; bis-[dimethyl-phenacyloxime]-diethyl-disulphur  
bromide; dimethyl cystamine; dimethylamino-diethyl disulphur;  
trimethyl-mercaptoethyl ammonium; and bis-[trimethylamino]-  
diethyl-disulphur iodide.

TITLE: Some aspects of the chemical combine of Craiova

SOURCES: Revista de chimie, v. 15, no. 3, 1964, 649-652

TOPIC TAGS: chemical industry, acetylene, ammonia, industrial statistic

Abstract: Author's English summary modified. A description of the new Craiova Chemical Combine, which is designed for the processing of methane gas by partial oxidation. The acetylene and ammonia produced are processed in two sections, of which the one produces butanol, octanol, acetic acid, polyvinyl acetate, etc., and the other processes the ammonia into fertilizers. Modern production methods result in low costs; for example, the cost of nitrogenous fertilizers is 32 to 34% lower than in other Romanian plants, and that of vinyl acetate 70% lower. Orig. art. has 1 figure.
