AUTHOR MARKUS S.
TITLE On functions being continuous in every variable.
PERIODICAL Doklady Akad.Nauk 112, 812-814 (1957)
reviewed 6/1957

Theorem 1: It exists a function $f(x,y)$ being defined in the unit square P , vanishing on an everywhere in P dense set E , being continuous in $P-E$ with respect to every variable and being not identically equal to zero in P .

Theorem 2: Let $f(x,y)$ be defined in G and satisfy the following conditions:
1) $f(x,y)$ is continuous in x in G , 2) it exists a set $E \subset G$ being everywhere dense in G , on which $f(x,y)$ vanishes, 3) $f(x,y)$ is continuous in $G-E$ in y . Then $f(x,y) = 0$ in G .

Theorem 3: Let $f(x,y)$ be defined in G , let exist a complement of a set of first category $E \subset G$ such that $f(x,y) = 0$ for $(x,y) \in E$, let $f(x,y)$ be continuous in $G-E$ in every variable. Then $f(x,y) = 0$.

Theorem 4: If the functions of real variables $f(x_1, \dots, x_n)$, $g(x_1, \dots, x_n)$ being defined in D are identical on a set E being everywhere dense in D ,

Erdős, P., et Marcus, S. Sur la décomposition de l'espace euclidien en ensembles homogènes. Acta Math. Acad. Sci. Hungar. 8 (1957), 443-452.

A non-null subset of Euclidean n -space E_n is homogeneous (Borel) if for each two of its points X, Y the translation XY transforms the set in itself. The authors show that there does not exist any decomposition of E_n into a finite number k of pairwise mutually exclusive homogeneous sets for $k > 1$. On the other hand, they prove that the E_n may be decomposed into m homogeneous, non-measurable sets E_i , superposable by translation, (and each containing a non-null perfect set) for $0 \leq m \leq 2^{K_1}$. Moreover, for each measurable set E of E_n , $\mu^*(E, \cap E) = \mu(E)$, $\mu_\epsilon(E, \cap E) = 0$, where μ^* , μ , μ_ϵ denote exterior measure, measure, and interior measure, respectively. Similar results for the line have been established by Ruziewicz [Fund. Math. 5 (1924), 92-95] and Halperin [Proc. Amer. Math. Soc. 2 (1951), 221-224; MR 12, 685].

1-F1W

Cet article contient quinze propositions dont les démonstrations dépendent plus ou moins de résultats antérieurs dus principalement à W. Sierpinski et St. Ruziewicz. La proposition extraite et sa démonstration peuvent être regardées comme originales et typiques. Proposition: Il existe un ensemble \mathfrak{M} de fonctions réelles, bornées, ponctuellement discontinues, intégrables au sens de Riemann (donc mesurables) et dérivables presque partout sur $[0, 1]$, isométrique à l'espace S des fonctions bornées $x(t)$ sur $[0, 1]$ métrisé par $\rho(x, y) = \sup |x(t) - y(t)|$. Esquisse de la démonstration: $r_1, r_2, \dots, r_n, \dots$: suite de tous les nombres rationnels de $[0, 1]$. Fonction auxiliaire: $\varphi(t) = \sum t^n 2^{-n}$, la somme $\sum t^n$ s'étendant à tous les n tels que $r_n < t$. A tout $x(t) \in S$ on fait correspondre la fonction $\xi(t) = x(\varphi(t))$ si $t = \varphi(t')$, = 0 si $t \in [\varphi(r_n - 0), \varphi(r_n)]$ pour un certain n . La correspondance $x(t) \mapsto \xi(t)$ est une isométrie; $\xi(t)$ est continue et à dérivée nulle presque partout sur $[0, 1]$.

MARCUS SOLOMON

I-FW
Marcus, Solomon. Sur une généralisation des fonctions
de G. Hamel. Atti Accad. Naz. Lincei. Rend. Cl. Sci.
Lis. Mat. Nat. (8) 20 (1956), 584-589.

Una funzione reale $f(x)$ della variabile reale x è interna nell'intervallo (a, b) se per $a < x < y < b$, quando non risulta $\min(f(x), f(y)) < f((x+y)/2) < \max(f(x), f(y))$, risulta

$$\min(f(x), f(y)) = f((x+y)/2) = \max(f(x), f(y)).$$

L'Autore studia le funzioni interne che non stano al tempo stesso monotone. Le funzioni interne non monotone sono, per esempio, le funzioni di Hamel, cioè le soluzioni discontinue dell'equazione funzionale $f(x+y) = f(x) + f(y)$. L'Autore prova che la totalità delle funzioni di Hamel non esaurisce quella delle funzioni interne non monotone; che il diagramma di una funzione interna e non monotona può anche non esser ovunque denso nel piano, mentre quello di una funzione di Hamel è notoriamente ovunque denso nel piano; che una funzione interna e non monotona è sprovvista della proprietà di Baire rispetto ad ogni insieme di seconda categoria, provvisto della proprietà di Baire e contenuto nell'intervallo (a, b) in cui la funzione è assegnata; che una funzione interna e non monotona, definita nell'intervallo (a, b) , non è qualitativamente continua in nessun punto di (a, b) . L'Autore studia le funzioni interne e non monotone anche dal punto di vista della connessione e della totale mancanza di connessione dei loro diagrammi. *G. Scorza Dragoni (Padova)*

✓ Marcus, S. Les conditions (T) de Banach pour les fonctions de deux variables. Rev. Univ. "C. I. Parhon" Politehn. Bucureşti. Ser. řti. Nat. 4 (1955), no. 8, 15-22. (Romanian. Russian and French summaries) The author observes that a theorem of Kronrod and Velskii [Kronrod, Uspehi Mat. Nauk (N.S.) 5 (1950) no. 1(35), 24-134; MR 11, 648] remains valid with the slightly weaker hypothesis: " $f(x, y)$, defined in the unit square, satisfies on almost all parallels to the axes the condition T_1 of Banach"; and that its conclusion, which states that "for almost all c the components of the set $\{f(x, y)=c\}$ are locally connected," may be thought of as one of the various two-dimensional analogues of T_1 . Another theorem of Kronrod is similarly modified and some corollaries and variants are mentioned. L. C. Young.

form

Marcus, S.

Marcus, S. La dérivée approximative qualitative. Com.
Acad. R. P. Române 3 (1953), 361-364. (Romanian;
Russian and French summaries)

The author defines for real functions of a real variable
the four qualitative approximate derivative numbers by
means of the qualitative approximate limits, in the sense
of his previous papers [same Com. 3 (1953), 9-12, 117-
120, MR 17, 20] of the usual difference quotients. Several
results paralleling known theorems for ordinary derivatives
are stated; for example, if two continuous functions
have the same derivative numbers everywhere in an interval,
except possibly at a countable set of points, then the
functions differ by a constant.

M. M. Day.

MARCUS S.

Marcus, S. Sur un théorème de G. P. Tolstov. Com.
Acad. P. Române 2, 5-8 (1952). (Romanian,
Russian and French summaries)

Tolstov's theorem says: If $f(x, y)$ is linearly continuous in a domain G and if the partial derivative with respect to x exists for all except possibly a countable set E of points of G , then every perfect set P contained in G contains a portion on which f is continuous (in both variables). The present note shows also that (1) the closure of the set of points of discontinuity of f is non-dense, (2) the set E of exceptional points is also non-dense, and (3) even if E is only assumed to be non-dense and F_σ , every interval intersecting G contains a subinterval of points where f is continuous.

Abstract :	In both cases a smooth, full leather is obtained which can be used for shoe uppers; however, the physicomechanical properties of the leather produced by the two variants of the process are not uniform. Thus the strength of the leather produced by the first of the above variants is 11-17.5% lower than that of the leather produced by the second variant. This is explained by the fact that preliminary vegetable tanning produces a considerable swelling of the skins and the result is that the number of fibers per unit surface area is decreased even though the absolute strength of the fibers remains unchanged. The selection of the

"Considerations on the Cytology of Tuberculous Pleural Exudates"

Bucharest, Revista Sanitara Militara, Vol 62, No 2, Mar-Apr 66, pp 257-261

Abstract: A cytological study of the elements in the pleural fluid exuded by tuberculous patients, with a view to using the structure of the exudate as an aid in diagnosis and prognosis. In the samples studied, eosinophilic types occurred in 7% of the cases, eosino-lymphocytic ones in 10%, lymphocytic ones in 80%, neutrophil serous types in 1% and mononuclear types in 2% of the cases.

Surfaces Which Are Minimal in the Projective Sense as Well as in the Euclidean Sense

Marcus, F. Surfaces minima projectives qui sont simultanément minima euclidiennes. Acad. R. P. Române. Fil. Iași. Stud. Cerc. Ști. Mat. 8 (1957), no. 1, 19-36. (Romanian. Russian and French summaries)

2
1-FW

It is shown that a minimal Euclidean surface which has a family of lines of curvature consisting of geodesics is minimal affine if it is minimal geodesic, and conversely. This suggests looking for the surfaces which are minimal in the Euclidean, affine, and projective senses. The equations of these surfaces are found in finite form. The surfaces are imaginary and have first fundamental form $ds^2 = (Au + Bu + C)^2 (du^2 + dv^2)$, with constants A, B, C such that $A^2 + B^2 + 1 = 0$, when referred to their asymptotic curves. These surfaces belong to a class described by Tziteica-Wilczynski; they are also of the third type of Terracini; they are also such that their Euclidean normals are principal lines of Fubini.

The author has defined I -congruences [same Stud. 3 (1952)] formed by normals to minimal surfaces and having minimal surfaces for focal nappes. The mean surface of an I -congruence is a minimal surface in the Euclidean, affine, and projective sense, and conversely.

MARCUS, F.

Marcus, R. Une nouvelle caractérisation des réseaux et surfaces de Cartan. Czechoslovak Math. J. 7(82) (1957), 308-313. (Russian summary)

E. Cartan a démontré l'existence d'une classe de surfaces douées d'un réseau conjugué tel que $h=\bar{h}$, $k=\bar{k}$, h, k , \bar{h}, \bar{k} étant les invariants des équations ponctuelles et tangentielle de Laplace correspondantes. Ces réseaux et les surfaces respectives sont nommés, par E. Cartan, réseaux et surfaces \mathcal{E} . Dans l'article présent l'auteur caractérise les réseaux et surfaces en question de la manière suivante: Si les lignes d'un réseau conjugué sont des pangéodésiques, le réseau et la surface appartiennent à la classe \mathcal{E} .
