TITLE: Influence of premedication upon the carotid angiogram

SOURCE: Ceskoslovenska neurologie, no. 4, 1965, 264-266

TOPIC TAGS: drug treatment, brain, blood, circulatory system disease

ABSTRACT:
The influence of hypotensive drugs frequently used in premedication upon the cerebral
hemodynamics is discussed. 5 cases are analyzed; it is probable
that in these cases premedication caused contrast filling of the
basilar artery and of its branches during carotid angiography.

Mathematical Physics.

Marx, G. Relativistische Elektrodynamik der Magnete.
Acta Phys. Acad. Sci. Hungar. 2, 67-84 (1952). (Russian
summary)

A theory of the electromagnetic field is developed in which there are permanent magnetic dipoles as well as charged particles. The presence of these magnetic dipoles is taken into account by introducing the additional term $-\frac{1}{2}F_{ab}M^{ab}$ into the Lagrangian, where F_{ab} is the usual anti-symmetric tensor and M_{ab} the magnetic moment tensor. The energy-momentum tensor is derived, from which the expression for the force on the magnet is obtained.

"Equations of Motion of a Magnetic Dipole".
Byui. Polsk. AN Otd. 3, 2, No 5, pp 217-222, 1954

The Einstein-Infeld-Hoffman concept of gravitational field is used for deriving equations of motion of a particle having electric and magnetic momenta. Solutions of Maxwell's equations are presented as sum of the external field and the field of the particle: the latter is expanded in series in $1/c$ powers. The coefficients of these series are determined and formulas present the solutions of the equations. (RZhFiz, No 10, 1955)

✗ Hald, J. Bull. Acad. Polon. Sci. Cl. III, 2 (1954), 475-479 (1955).
The classical relativistic equations of motion of a particle in a scalar field are investigated. It is found that the rest-mass is in general not constant. In the case of a scalar, attractive, meson-field, the rest-mass (but not the total mass or energy) will vanish at some distance from the center of force and the velocity there will be equal to that of light. For smaller distances the effective force on the particle will be repulsive.

The field due to a moving dipole of moment m is obtained as a power series in c . The force on the dipole is calculated from considerations of field momentum and expressed in the form $K = (m - v)H + E \times m/c + (v \times m) \times H/a$, where E and H are the intensities of the external field. The self-force term K is not discussed in the present note.

new method of determining the spin density
in the magnetic band. J. Phys. Chem.
Vol. 61, No. 1, p. 107-110, 1957.

An electron beam traveling through a transverse magnetic field suffers a direction spread. If experimental conditions are suitably chosen, the direction spread seems to be due only to the quantum dispersion of energy exchange between free electrons and r.f. field. A simple collector electrode system might allow one to detect the direction spread of the electrons, but the presence of a quantum effect might be checked by plotting the collector current versus r.f. field amplitude, the plot for the quantum effect being different from those for classical effects.

Title: On the Problem of Scattering of Photons by Neutrinos

Original Periodical: Acta phys. Acad. sci. hung., 1955, 5, No 3, 357-368, German

Abstract: The scattering of photons by neutrinos is considered in accordance with the perturbation theory as the decomposition of the neutrino into 2 virtual nucleons and an electron, the scattering of the photon by the virtual electron, and the formation of the final neutrino. The matrix element corresponding to this fourth-order process is proportional to e^2/f^2 , where e is the electron charge, and f is the Fermi interaction constant. The divergence is eliminated by cutting off the virtual particle with respect to the momentum. The cross section is estimated at approximately 10^{-60} cm. A hypothesis is made that along with scattering of light by nuclei, the scattering of light by neutrinos may play a substantial role in astrophysical processes.

Title : Variational Principle for Dielectrics.

Orig Pub : Byul. Pol'sk, L V. Otd. III, 1956, 4, No 1, 29-35

Abstract : The author considers the variational principle of the electrodynamics of dielectrics. The first portion is devoted to the derivation of the equations of motion and the energy-momentum tensor in relativistic hydrodynamics of an ideal liquid. If one employs as the Lagrangian the simplest invariant, it is possible to obtain in the usual manner the known equations of motion; these equations can be represented in the form analogous to that given by Verlet (Referat Zhur Fizika, 1954, 11077) for the equations of motion in the scalar meson field. In the second portion the above arguments are generalized

Card 1/2

to include a dielectric liquid, having a certain space charge. By supplementing the Lagrangian invariance connected with the electrodynamic field, we obtain the energy-momentum tensor as a result of applying the variational method. This tensor is a covariant generalization of the Abraham tensor. The resultant tensor is examined in greater detail for the case of incompressible liquid; it is the sum of the tensor of a moving ideal liquid and the Einstein-Laub tensor for a dielectric at rest. Considering that the density of the dielectric medium is increased by the polarization energy, the author finds that the resultant expression is the sum of the tensor of the moving ideal liquid and the tensor obtained by Kluitenberg (Kluitenberg, G.A., Thesis, Rotterdam, 1954) by a thermodynamic consideration. Thus, the Abraham, Einstein-Laub, and Kluitenberg tensors are particular cases of the tensor obtained by the author.

Title : Concerning the Transfer of Momentum by Continuous Electromagnetic Waves in Dielectric Media.

Orig Pub : Byul. Pol'skoy N, 1956, Otd. 3, 4, No 2, 75-77

Abstract : An analysis is given of the derivation obtained by Rubinovich (Roforat Zhur Fizika, 1956, 21772), on the basis of an investigation of Abraham's energy-momentum tensor, concerning the transfer of momentum to a dielectric by the moving surfaces of the discontinuity of the electromagnetic field intensity. The discontinuity $\Delta \underline{E}$ creates in the dielectric an increment in polarization, i.e., a motion of charges. The corresponding density of polarization current is $\int (\epsilon - 1)/4\pi v \cdot \Delta \underline{E}$, where v is the speed of wave propagation in the dielectric. In this case the medium should be acted upon at the point of discontinuity, by the same force as is produced in the case of the conduction

1427 THE PROBLEM OF PULSE TRANSMISSION BY LIQUID ON TIN
L.M.B. and J.N.P.

Inst. Acad. Polon. Sci., Warsaw, Poland

1964

J. C. Rabinowicz, Acta Phys. Polon., Vol. 14, No. 3, 1955, pp. 225-31. (Also given an expression for the field impulse derived from the integral form of the conservation law - in the case where the surface current and surface charge, which are the source of discontinuity, are zero.)

The problem of the transmission of an electric and magnetic field arriving in a homogeneous medium have an impulsive form. The source of this phenomenon is not understood and the present paper examines the case of media with both conduction and elastically bound electrons. It is concluded that the results of Rabinowicz are consistent with the conditions in the media.

' Marx, György; and Román, Pál. Energy and momentum in the general theory of fields.' / Magyar Tud. Akad. Mat. Fiz. Oszt. Közl. 6 (1956), 269-287. (Hungarian)

This paper contains an exposition of the different methods one can use to generate the energy-momentum tensor in field theories. These methods are based on the invariance of the Lagrangian under certain variations. 1) Hilbert's method: The invariance of the Lagrangian with respect to variations of the metric tensor gives the (symmetric) energy-momentum tensor; 2) Belinfante's method: The invariance of the Lagrangian with respect to variations which correspond to infinitesimal inhomogeneous Lorentz transformations enables us to construct a nonsymmetric canonical energy-momentum tensor which can be symmetrized, giving the energy-momentum tensor. The authors then show that the two methods generate the same energy-momentum tensor, if the system is closed (i.e., if the divergence of the energy-momentum tensor is zero); if the system is open, only method 1) can be used. Large numbers of applications are given; the authors construct the energy-momentum tensor for scalar fields, pseudo-scalar fields, spinor fields and Maxwell-fields, without and with sources.

Title : Theoretical Relations of the Fctvos Law

Orig Pub : Magyar fiz. folyoirat, 1957, 5, No 2, 123-135

Abstract : An article of survey character. The authors, following Born and Courant (Born M., Courant R., Physik Z., 1913, 14, 731) derived the Eotvos law of surface tension on the basis of principles of thermodynamics with the use of the Planck quantum hypothesis. It turns out that in the formation of surface tension, a great role is played by the so-called capillary waves which have a quantum character. The application of the law to nuclear phenomena gives a correct order of the energy of evaporation of the nucleus (corresponding to a case where the surface tension equals to zero).

13. The theorem of the conservation of the fermion number and the principle of the minimum number of states in the theory of the neutrino.¹³ G. v. Marx. A Magyar Tudományos Akadémia Közponi Fizikai Kutató Intézetnek Közleményei (Proceedings of the Central Research Institute for Physics of the Hungarian Academy of Sciences). Vol. 5, 1957, No. 3, pp. 305-313; 4 figs.

Two simplifying principles may be introduced concerning the neutrino, the theorem of the conservation of the fermion number and the minimum condition for the number of the possible states of elementary particles. Among the "classical" neutrino theories the first has been accepted by the Fermi theory, the second being adopted by the Majorana theory. After dispensing with the law of the conservation of parity both principles may be applied simultaneously as can be seen from the Landau theory. The possibility of applying both principles for the decay of μ mesons and other particles is investigated.

MARY C.

Marx, G. Innere Arbeit in der relativistischen Dynamik
Acta Phys. Acad. Sci. Hungar. 6 (1957), 353-375
(Russian summary)

The aim of this paper is the relativistic investigation of the types of forces different and more general than the Lorentz force. The starting points are the usual four dimensional laws of mechanics. It is shown that the action of such a general force changes the energy of the particle in two ways, either by changing its kinetic energy or by changing its rest mass. This latter effect is carefully analyzed.

L. Infeld (Warsaw).
