Card 1/1 Pub. 133 - 4/19

Authors : Mel'nikov, P. V., and Leybman, Yu. A.

Title : Electronic instruments for measuring distortion of start-stop (manual) telegraph signals

Periodical : Vest. svyazi 6, 6-8, June 1955

Abstract : Operational principles of two electronic instruments designated to measure distortion in manual telegraph signals, are described. One of the instruments automatically controls the telegraph channel and signals the raise and magnitude of distortions, and the other instrument, equipped with a cathode-ray tube permits visual determination of the magnitude and characteristics of distortions in each transmitted signal. Diagrams.

AUTHOR: Mel'nikov, P. V.

TITLE: On the problem of the measurement of the characteristic function  
of a stationary ergodic process

PERIODICAL: Elektrosvyaz', no. 12, 1962, 19 - 25

TEXT: Dealing with the measurement of the characteristic function of  
stationary ergodic processes, the author shows first how the argument interval  
must be chosen so that the characteristic function should be unambiguously de-  
termined by the results of measurements, i.e. by the readings. The expression  
underlying the design of the device for the measurement of characteristic func-  
tions of ergodic processes is

$$\mathcal{P}(s, T) = \frac{1}{T} \int_0^T \cos [x(t)s] dt + \frac{1}{T} \int_0^T \sin [x(t)s] dt$$

s being the argument of the characteristic function. Resorting to Kotel'nikov's

A055/A126

theorems for the characteristic function and the probability density, the author shows that the limited-spectrum characteristic function  $\mathcal{P}(s)$  is fully determined by its instantaneous values measured at intervals  $\tilde{\Delta}x_m = \Delta s$ ,  $\Delta s$  depending thus on the maximum instantaneous value of the signal  $x_m$  which occurs in the communication system. He deduces an expression giving  $\mathcal{P}(s)$  in terms of  $\Delta s$ , and applies this expression to a practical case. He also deduces two formulae linking the measured values of the characteristic function respectively with the probability density of the investigated random process and the one-dimensional integral law of the distribution of probabilities, as well as a set of formulae linking the measured values of the characteristic function with the distribution moments. The accuracy of the deduced formulae was checked and found satisfactory. There is 1 table.

Title : The Blood Distribution in Traumatic Shock.

Orig Pub : Tr. Vses. konferentsii po med. radiologii. Eksperim.  
med. radiol. M., Medgiz, 1957, 270-272.

Abstract : Rabbits were intravenously inoculated with marked  $P^{32}$  erythrocytes; 20-30 minutes after the injection, a shock was effected in the animals by pulling at their mesentery. In the state of a 4th degree shock, the animals were killed. The tissue activities (TA) of the liver and of the kidneys were not changed. The tissue activity of the spleen was 0.2 percent of the administered  $P^{32}$  dose per each 1 gr of the tissue as against 0.32 percent in control animals. TA of the skeletal muscles

TITLE: A device for converting the parameters of a light flux to electric signals of a rectangular shape. Class 21, No. 180626

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 8, 1966, 30

TOPIC TAGS: signal processing, light value, electronic signal

ABSTRACT: This Author Certificate presents a device for converting the parameters of a light flux to electric signals of a rectangular shape with a variable spacing. The device is made on the basis of a blocking generator circuit. The converter includes a power supply source, a photodiode, a transformer, and a diode-capacitance temperature compensation ladder network. The design simplifies the device and broadens the frequency range of the pulses being generated. The collector electrode of the photodiode is connected to the negative terminal of the power supply source through the transformer primary winding. The base electrode of the photodiode is connected to the transformer secondary winding. The diode-

capacitance temperature compensation ladder network is connected in series to the circuit of the transformer secondary winding. The emitter of the triode is connected to the positive terminal of the power supply source and through a capacitor to the temperature compensation ladder network.

AUTHOR: Mel'nikov, S. S.; Yevstigneyev, V. B.

TITLE: Separation and spectral properties of chlorophyll c

SOURCE: Biofizika, v. 9, no. 4, 1964, 414-422

TOPIC TAGS: photosynthesis, photosynthetic pigment, tetrapyrrol pigment, chlorophyll, chlorophyll a, chlorophyll c, chlorophyll absorption spectra, chlorophyll luminescence spectra, algae chlorophyll, algae pigment

ABSTRACT: This article is a report of the first Soviet attempt to obtain and chromatographically purify chlorophyll c from algae. A method for obtaining this compound in large quantities from dry algae was developed at the Institute of Biochemistry, AN SSSR, and the Laboratory Biophysics and Isotopes, AN BSSR. There were no differences between the pigment obtained from dried algae and that obtained from fresh plants. If dried brown algae (*Fucus* and *Cystoseira*) were used, all the pigments present in the plant mass were extracted with acetone containing aqueous ammonia; from this extract

1/3

Card

ACCESSION NR: AP4042474

chlorophyll a and part of the carotenoids were removed by extraction with petroleum ether; the residual pigments were paper chromatographed from the condensed ethyl ether solution; the main difficulty consisted in separation of chlorophyll c and pheophorbide a, since the pigments contain no phytol and have similar chromatographic properties. The best separation was achieved by using a mixture of gasoline (bp 95—105°C), petroleum ether (bp 40—60°C), and isopropanol in the ratio of 5:1:1/2. The chlorophyll c content in Cystoserira is 3.5 times higher than in Fucus, constituting 0.4 mg of pigment in 1 g dry weight of algae. A slightly modified method had to be used for the diatomic algae Phaeodactylum tricornutum because of splitting of chlorophyll a by chlorophyllase in the cells. The final separation from pheophorbide was completed as above. Repeated chromatographic purification produced practically pure chlorophyll c. The pigment is insoluble in organic nonpolar solvents and soluble in polar solvents. Its solution in acetone is emerald green with a scarlet fluorescence. It forms a copper-red sediment 85% ethanol, in which hexagonal crystals were observed. The pigment is rather stable. The absorption and luminescence spectra of the pigment and its pheophytin were obtained. The pigment is capable of association, which is important in connection with its state in live algae. The significance

2/3

ACCESSION NR: AP4042474

of the study of the pigment is stressed by the fact that approximately 80% of the total plant-synthesized organic substance is produced by algae in the World Ocean, and according to S. W. Jeffrey, the amount of chlorophyll c in algae is 30—80% of that of chlorophyll a.

Nr 12, pp 168-187

ABSTRACT: Description of the hydraulic conveyor installation, the physicochemical properties of solid pulp constituent, the equipment of the pulp lines and of the pulp pumping station, the nature of the pulp's motion, operational experience with the pulp lines, and the regulating and measuring equipment of the station. When a suction dredge with an output of 3600 m<sup>3</sup>/hr is employed, the 40 m<sup>3</sup> pulp storage tank, as well as the electric motors, rated at 750 kw (for pump dredges of 1100 mm in diameter), and 900 kw (for a diameter of 1250 mm), recommended by the M. I. Kalinin plant, are evidently inadequate. At a pulp flow of 3600 m<sup>3</sup>/hr, a pulp line 800 mm in diameter carries a constant layer of sludge

The Employment of the Hydraulic Conveyor Installation (cont.)

only 300 mm deep throughout the line, which points to the irrational utilization of the available cross sectional area of the pipe line. In order to improve the wear resistance, components of the suction dredges should be coated with rubber or with abrasive materials.
