Comparative studies of the morphology of *Candida albicans*
on some selective media. Ref.med.fak. Zagreb no. 2
173-179-163

YUGOSLAVIA

GALINOVIC-WEISGLASS, Marija, and KIGIC, Emil, Andrija Štampar Public Health School (Škola Narodnog Zdravlja "Andrija Štampar") and Croatian Public Health Institute (Republički Zavod za Zaštitu Zdravlja), Zagreb.

"Comparative Morphological Studies of Candida Albicans on Certain Selective Culture Media."

Zagreb, Radovi Medicinskog Fakulteta u Zagrebu, Vol 11, No 2, 1963, pp 163-179.

Abstract: [Authors' English summary modified] Comparative studies of the macromorphology of 100 strains of Candida Albicans were performed with the culture media of malt agar, Sabouraud-dextrose agar, Littman agar, 5-percent blood agar containing serum, Clauberg II, serum-tellurite agar containing bismuth and biotin, and agar containing bismuth and glycine at temperatures of 27 and 37 degrees centigrade over a period of 14 days. Growth in none of these media was sufficient to suggest with certainty that Candida albicans was present. The strains were identified through biochemical procedures. All fermented carbohydrates in a manner characteristic of Candida albicans. Mycostatin sensitivity was tested with the disc method.

Four tables, 14 photographs, one Yugoslav and 31 recent Western references.

Orig Pub. : Tekstil, 6, no 4, 349-351 (1957)

Abstract : Methods used in the identification of dyes applied to animal and vegetable fibers, acetate rayon, nylons and perlon are described. Tables are given of the reactions of dyeings with various reagents (water, soap solution, ammonia, ammoniacal $\text{Na}_2\text{S}_2\text{O}_4$, alconolic glacial CH_3COOH solution, SnCl_2 , $\text{Na}_2\text{S}_2\text{O}_4$, NaClO , conc H_2SO_4) which can be used in the identification of the type of dyes used.

TITLE: Production of 98% nitric acid

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 23, 1962, 454-455,
abstract 23K100 (Pol. pat. 44899, Sept. 21, 1961)

TEXT: The waste water from the cooler, formed during the production of 98% HNO_3 , by the absorption of nitrous gases in nitrooleum, and about 25% of the waste water from the oxidation tower are fed directly to the bottom of an absorption tower where they are mixed with nitrooleum at a temperature of -10 to -12°C in the presence of uncompressed O_2 arriving at the rate of 6-7% with nitrous gases. Under these conditions the reaction $\text{N}_2\text{O}_4 + \text{H}_2\text{O} + \frac{1}{2}\text{O}_2 = 2\text{HNO}_3 + 31.89 \text{ kcal}$. The O_2 consumption is 165 m³ per ton of 98% HNO_3 produced. [Abstracter's note: Complete translation.]

TITLE: Some data on the geochemistry of manganese concretions in the Indian Ocean

SOURCE: Geokhimiya, no. 5, 1963, 493-499

TOPIC TAGS: concretions, Mn, Nb, Ta, Th, V, Co, Ni, Ce, Fe, rare earths, red clay, diagenesis, Indian Ocean

ABSTRACT: Two concretions and samples of red clay, collected by L. M. Khitrov from depths below 5000 m in the Indian Ocean, were used in this study. A distinct difference in composition was found between inner and outer zones of the concretions, the inner zone being richer in silica and alumina and poorer in iron, manganese, and the rare elements (Nb, Ta, V, Th, and rare earths). Red clay has a composition nearer that of the inner zone. The authors conclude that the composition of the inner zone suggests volcanic origin and that correlation between oxidation-reduction potentials and concentrations of Mn, Co, Ni, Ce, V, and Fe in the concretions points to the importance of these potentials in the formation of manganese concretions. "In conclusion, the authors consider it their pleasant duty to express gratitude to L. M. Khitrov for supplying the material for study,

616. MIGDATA. *Azotniak a stan zdrowia pracowników zajętych przy jego wysiewie. Calcium cyanamide and the health condition of workers occupied at its dissemination (Polish text) POL.TYG. LEK. 1956, 11/11 (489-494) Tables 1

Calcium cyanamide is a valuable artificial manure. Its frequently harmful influence is due to neglect of simple prophylactic measures, accessible to every agricultural worker. The factors necessary for the development of post-calcium cyanamide lesions as an occupational disease are discussed, based on observation and treatment of 45 patients. Besides the subjective symptoms, skin lesions, lesions of mucous membranes, and - in several cases - general symptoms as well were noted. From accurate analysis of pathological symptoms, laboratory routine examinations, complex tests of the liver function and functional skin tests conclusions are drawn concerning the toxic action of calcium cyanamide and the importance of the condition and care of the skin. The value of skin functional tests for the possibility of excluding from work the persons with a decreased resistance of the skin is emphasized. A number of directives are given, which if observed will prevent to a large extent the appearance of the described pathological lesions; methods of treatment are discussed.

Abstract: Author's English summary modified/The definition, etiology, pathogenesis, pathology and clinical picture of listeriosis are briefly presented. The two commonest forms are a septic form occurring mainly in the newborn and a neural forms occurring chiefly in older children and adults. Two cases are reported on: 1) a male, aged 36, with the disease manifested as septic-pyemia with some changes in the lungs; listeria cultures were obtained from blood samples and throat swabs; 2) a 2 years, 9 months baby with relapsing neural form manifested as encephalitis with hydrocephaly and mental deficiency. 60 references, mainly Western

MIGDALEWSKA -
3052. ERYTHROLEUKAEMIA (DI GUGLIELMO) - Erythroleukaemia (Di Guglielmo) - Migdalska Z., Siciński A., and Klemczyńska I. I Klin. Chor. Wewn. A.M., Warszawa; Klin. Stomatol. A.M., Warszawa - POL. ARCH. MED. WEWNĘT. 1957, 27/5 (665-672) Tables 1 Illus. 5
A case of erythroleukaemia in a 22-year-old patient with considerable inflammatory lesions in the oral cavity is described. The course of the disease as well as haematological and biopsy tests speak in favour of the conception that erythroleukaemia consists of a pathological pseudoneoplastic proliferation of the haemopoietic system of a type of acute erythaemia and acute paramyeloblastic leukaemia. These lesions lead to anaemia and to systemic hyperplasia with the appearance of organic metaplasia and with dissemination of the youngest pathological cells to the blood. In the case described acute erythroleukaemia was induced most probably by an infectious factor. Proliferation of the erythrocyte system consists in its pathological, illimitable hyperplasia, as in paramegaloblastic hyperplasia. Proliferation of the leucocyte system had the features of proliferation proper to acute paramyeloblastic leukaemias. The transitory forms in the haematological picture may be considered a support for the conception that both paramegaloblasts and paramyelocytes originate from the histioblasts.

2337. THE MONOCYTOID RETICULUM CELLS AND THEIR SIGNIFICANCE -
Monocytoidalna komórka siateczki i jej znaczenie - Migdalska Z.
I Klin. Chor. Wewn. A. M., Warszawa - POL. ARCH. MED. WEWNĘT.
1956, 26/10 (1491-1498) Illus. 3

The so-called large lymphocytes, which are essentially different in structure from the usual lymphocytes, correspond with undifferentiated mesenchymal cells and are referred to as monocytoid reticulum cells. These mesenchymal cells do not normally play an important rôle. In the case of pathological conditions, however, if one or several systems of the haemopoietic apparatus have been damaged, the number of monocytoid reticulum cells in the haemopoietic centres and the peripheral circulation shows a compensatory increase; the cells show further maturation and undergo various qualitative changes.

Title : Pernicious Anemia (Addison-Biermer's Disease) in the Light
of Biopsy Studies.

Orig Pub : Polskie arch. med. wewnetrz., 1955, 25, No 6, 1107-1116.

Abstract : As a result of his studies of bone marrow differential counts,
splenomegaly and liver punctures and the peripheral blood of 32
cases of pernicious anemia (Addison-Biermer's type of anemia),
the author concludes that the whole hematopoietic system is
involved in this disease. Erythroid series is particularly
involved but involvements of the leucocytic and reticuloendothelial
series may also be noticed. On the basis of these involvements
the author singled out 3 pictures of disease and emphasized
the course of bone marrow metaplasia in hematopoietic organs.

1943. MIGDALSKA B. and MASSALSKI W. *Wstępne badania nad zawartością kwasu pirogronowego we krwi. Preliminary research on the pyruvic acid content in the blood POL. ARCH. MED. WEWNĘT. 1956, 26/7 (1117-1118)

The determinations were made with the Friedemann's and Hange's method. The pyruvic acid level in the blood was determined in 10 healthy persons in the fasting state. The mean value amounted to 0.38 ± 0.05 mg./100 ml. A number of determinations were carried out in normal persons and in carbohydrate metabolism disorders. The pyruvic acid level and the glucose level in the blood were determined simultaneously after 50 g. of glucose orally. The results obtained up to now allow the following conclusions to be drawn: (1) In persons not showing any disorders of carbohydrate metabolism no distinct dependence of the pyruvic acid level on the glucose level was found. (2) In cases of carbohydrate metabolism disorders sometimes a decrease of the pyruvic acid content in the first hour after the oral administration of glucose existed. (3) It seems worth while to determine simultaneously the pyruvic acid content in the blood and in the urine.
