Mercury-jet commutators used in multiple-point control systems.
Priborostroenie no.11:15-18 N '58. (MIRA 11:12)
(Electronic control) (Commutation (Electricity))

SOV/113-58-11-6/15

Mercury Jet Commutators in Systems for the Control of Many Points

time for contact	~ 0,0015 sec.
transition-resistance	< 0,05 Ω
maximum contact current in the case of inductionless load	0,5 A
maximum voltage between contacts	100 V
insulation resistance between contacts after long operation	> 1 M Ω
power output of the motor	10 VA
weight of the commutator including motor	5 kg

Two examples showing the working of the mercury-jet commutator are given both in the block-scheme and in the principal wiring circuit:

- a) A signal system indicating deviations from the adjusted parameters, where a Braun-tube is used as a signal panel.
 - b) A signal system indicating deviations from the adjusted parameters, in which Neon lamps are used as a signal panel.
- There are 7 figures.

TITLE:

Mercury Jet Commutators in Systems for the Control of Many Points (Rutno-stryuynyye kommutatory v sistemakh mnogotochekh-nogo kontrolya)

PERIODICAL:

Priborostroyeniye, 1959, Nr 11, pp 15-18 (USSR)

ABSTRACT:

In a mercury jet commutator a tube rotates in a fixed container filled with mercury; the end of the tube is tapered like a jet. The jet is filled with mercury by means of a centrifugal force. When leaving the jet, the mercury reaches contacts and thus closes a circuit. A sectional drawing of a 2-bank commutator is given. This 100-point commutator has the following technical data:

diameter of case	250 mm
height including electromotor	150 mm
number of contacts in one bank	100
number of banks	2
time needed for one revolution	~ 0.3 sec.
switching-over time	0.0035 sec.

Krause A., Kotkowski S., Milewski M. Zinc Sulphides in the Process of Decomposition of Hydrogen Peroxide Solution.

"Starczki cynku jako katalizatory w procesie rozkładu wody utlenionej". Przemysł Chemiczny, No. 2, 1954, pp. 66-68, 7 tabs.

The process was investigated of decomposing H_2O_2 in the presence of zinc sulphides: wurtzite, sphalerite and ZnS precipitated from $ZnSO_4$ solution. Natural and precipitated sulphides activated by some form catalytic compounds showing distinct differences as regards the rate of decomposition of hydrogen peroxide solution. In this way, some minerals can be characterized and isolated as industrial catalysts.

Effect of artificial hibernation...
with a peak increase of no more than double after 6 hours,
and return to normal level after a few days. Shock (II)
produced a rise in GPT by 20 times and in GOT by 10 times,
with the same results for rats hibernated prior to the
shock (III). Authors conclude that, as assessed from blood
transaminase activity, the Noble-Collip shock was not pre-
vented by artificial hibernation. There are 2 tables and
2 figures, and 14 references, of which 4 are Polish and 10
Western.

Effect of artificial hibernation...

I - 90 rats in which hyperthermia and hibernation were induced, II - 200 rats subjected to traumatic shock, and III - in which both I and II were induced. Artificial hibernation was produced by injection of a lytic cocktail, composed of 3 g each of largactil and phenergan and 6 mg per kg of body weight of dolantin, and subsequent air-cooling at - 20°C. Traumatic shock was produced by the Noble-Collip method in a drum designed by the authors for 15 minutes at 45 rpm. GPT and GOT determinations were made by the Reitmann and Frankel colorimetric method on samples of aspirated blood, flowing directly to the chest cavity after resection of one lung of the etherized animal, drawn after 1, 2, and 6 hours of hibernation, 12 hours after cooling to 19°C (or 6 hours after rewarming), and at daily intervals during the first week, or at the same intervals after induction of shock. Authors established that without shock (I), hibernation increased moderately the activity of the two enzymes,

TITLE: Effect of artificial hibernation on serum transaminase activity of rats in normal conditions and in traumatic shock?

PERIODICAL: Acta Physiologica Polonica, v. 14, no. 1,
1963, 45-54.

1965, 1966

TEXT: As a link in the authors' comprehensive study on the pathogenesis of shock and the biochemical, especially enzymatic, factor in shock mechanism, the authors undertook the above study [see title] to determine the hitherto unstudied effect of hibernation on the enzymatic processes which change so typically in shock, and specifically how it affects traumatic shock evaluated on the basis of transaminase activity in the serum. Study comprised 330 rats divided, in addition to controls, into three groups:

4448. DEVELOPMENT OF PEPTONE SHOCK IN HYPOTHERMIC DOGS - Verlauf des Peptonschocks bei künstlich unterkühlten Hunden - Mietkiewski E., Gracki H. and Szczepański B. Physiol. Inst. Med. Akad., Szczecin - ARCH. INT. NEUROL. 1958, 117/3-4 (328-340) Graphs 5 Tables 5
Experiments were performed on hypothermic dogs (thiopental anaesthesia, body temperature 25-26°). I.v. injection of a 25% solution of peptone (1.2 ml./kg.) produced in control animals and also in hypothermic dogs a shock state which was not much influenced by simultaneous administration of chlorpromazine (4-5 mg./kg.). Chlorpromazine sometimes even protracted the duration of shock. I.v. administration of antazoline (5-10 mg./kg.) did not completely abolish the manifestations of peptone shock; only the blood pressure and the frequency of respiration returned more quickly to the normal state. It is suggested therefore, that the mechanism of this form of shock depends on a direct toxic action of the injected peptone and not only on the release of endogenous histamine. Guzek - Cracow (II, 5*)

P.A.M. 1958, 4 (181-192) Grapha II

Four experimental groups of animals have been used by the author to determine the influence of experimental hypothermia on the origin, course and cessation of anaphylactic shock brought about by pigmentary, histamine and hypotensive toxic ACh reactions. Although the experimental hypothermia does not fully prevent the onset of anaphylactic shock, it weakens the anaphylactic reaction and reduces the mortality rate of experimental animals.

Title : Peptone Shock in Dogs during Artificial Cooling
Orig Pub : Acta Physiol. Polon., 1957, Vol. 8, No. 4, 637-653

Abstract : Under pentothal narcosis 25 dogs were caused to undergo shock by the injection into the blood stream of 1.2 ml/kg of a 20 percent solution of peptone. In those cooled to 25-26 degrees C, shock came on more slowly and was milder than in the normal, but the manifestations of shock persisted longer than in the normal controls. The preliminary injection of four to five mg/kg of largactyl to the cooled animals deepened the peptone shock. The intravenous injection of four to ten mg/kg of antistine did not protect the anesthetized dogs from the development of shock, but the manifestations of shock were eliminated more quickly. In non-cooled con-

✓ Chemoreceptors in the blood vessels of the rabbit ear.
Eugeniusz Mietkiewski (Physiol. Inst. Med., Szczecin, Poland). *Arch. intern. pharmacodynamie* 104, 373-47 (1950) (in German). --The perfused rabbit ear, isolated except for the nerve, was used to investigate its chemoreceptors. Adrenalin, nicotine, or acetylcholine added to the perfusion fluid cause a sudden and profound drop in general arterial pressure as well as contraction of the ear vessels. The rate and amplitude of the respiration is increased. These reflex changes are not altered by cutting the vagus or the sympathetics in the neck or by paralysis of the nerve endings in the ear, nor by procaine or other local anesthetics in the perfusion fluid. ✓ Interference with biliary secretion following the injection of dyes. E. Czarnocki, J. Kiersz, and E. Mietkiewski. *Intern. Arch. Allergy and Appl. Immunol.* 2, 24-6 (1951). In certain dogs a complete arrest of bile secretion within 10 min. after the injection of trypan blue was found. In others a slow decrease to zero was noted. This was attributed to histologic changes in the liver following blockage of the reticulo-endothelial system by the dye. Elmer L. Becker

(1)

Mietkiewski, S.

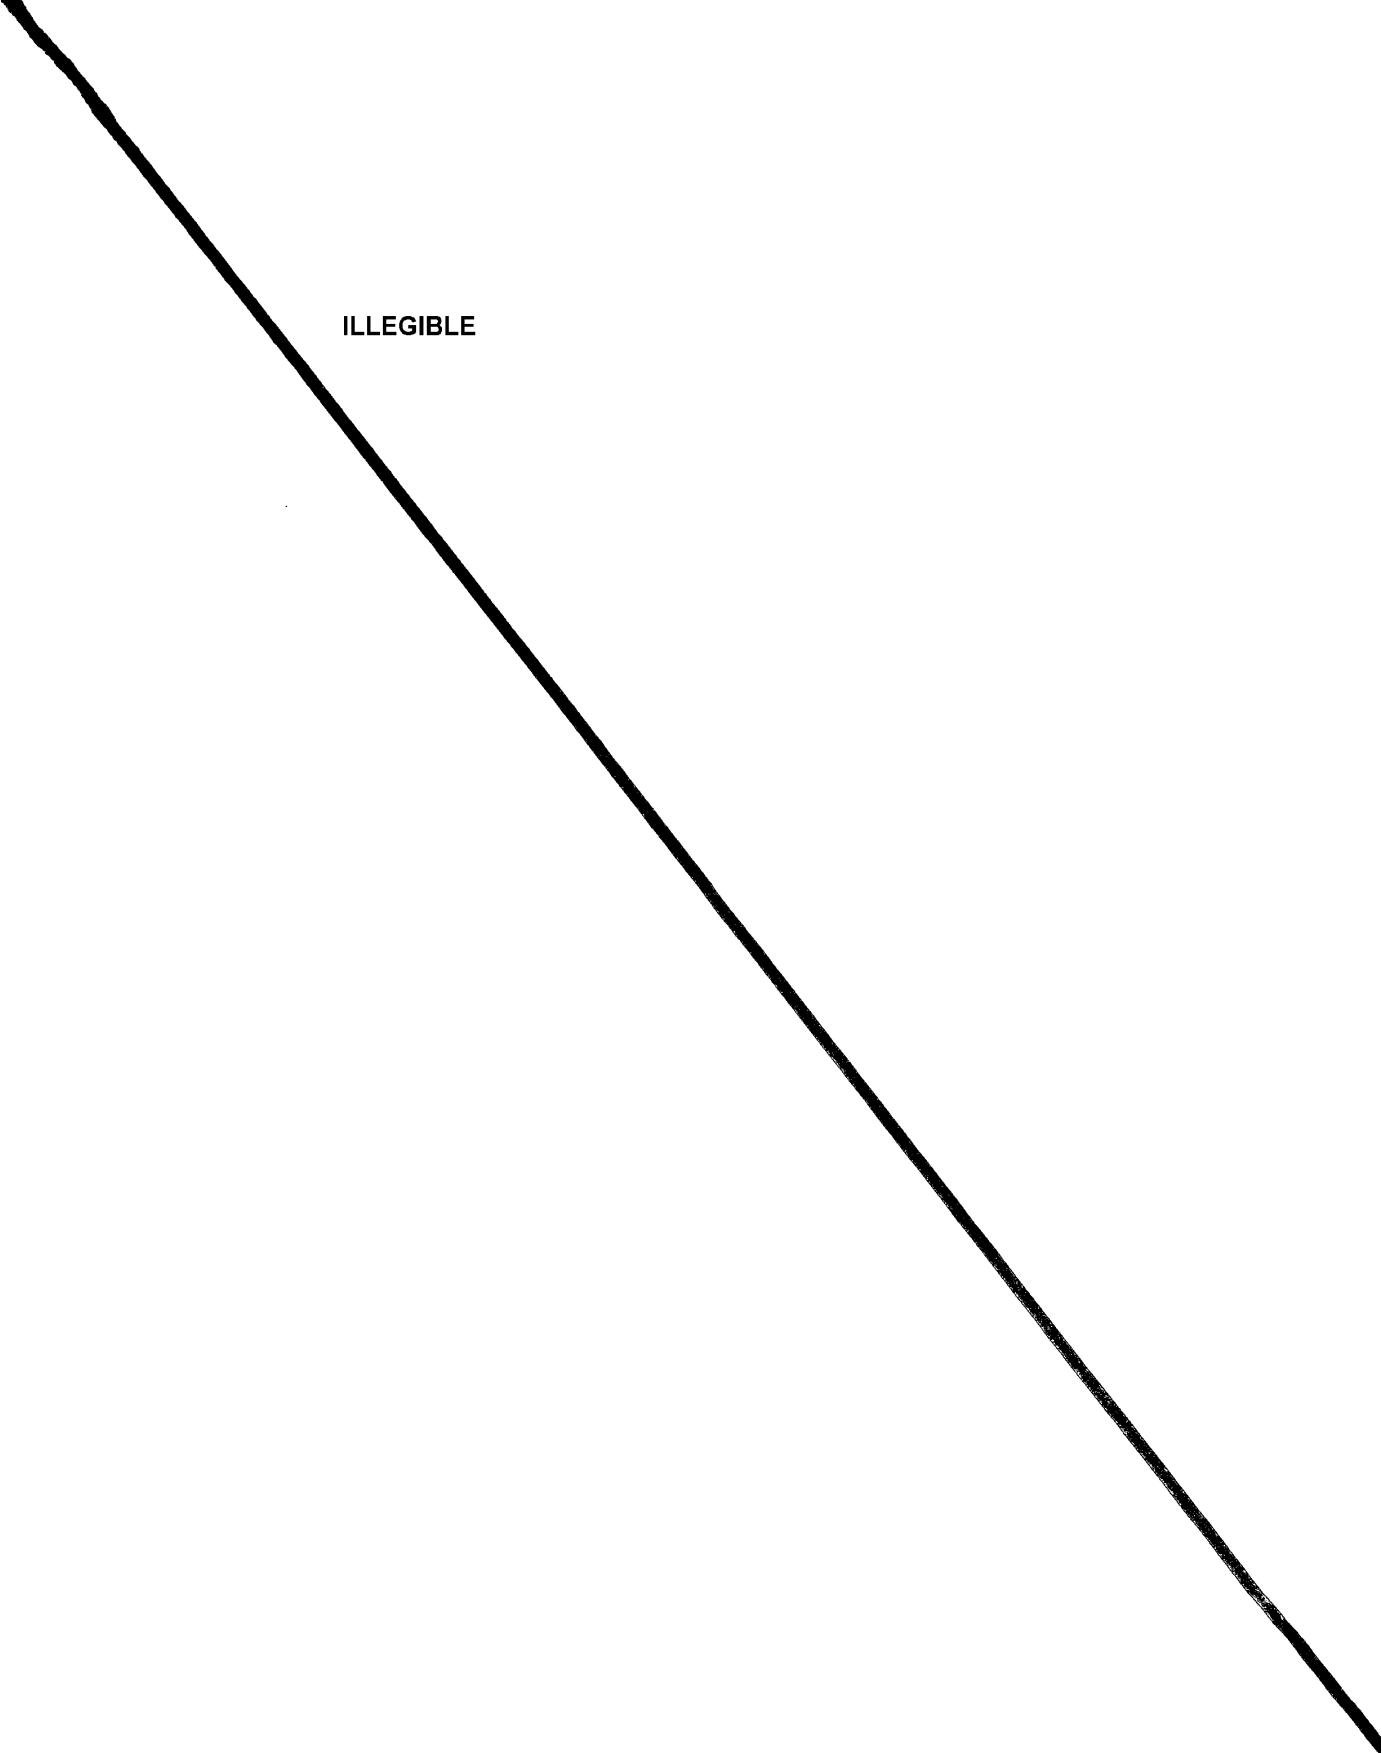

✓ Changes occurring in the blood following injection of dyes. B. Czarnecki, J. Kiersz, and E. Mietkiewski (Univ. Poznan, Poland). *Intern. Arch. Allergy and Appl. Immunol.*, 2, 8-18 (1951).—Immediately after intravenous injection into dogs of 0.1 g./kg. of either trypan blue or Congo red the animal shows an increased flow of saliva, change in respiration, vomiting, a lowering of the blood pressure, and other symptoms of shock. The erythrocyte sedimentation rate is decreased, coagulation time is increased, the blood viscosity is increased, and the f.p. depression of serum decreases during the first 10 min. after the introduction of the dyes, while these changes are reversed within 1.5 to 3 hrs. Platelets are absent during shock. The authors conclude that the shock resulting from the injection of dye is provoked by a derangement of the histioocyte system, paralleling anaphylactic shock. E. I. B.

MITSKIEWSKI EUGENIUSZ

Influence of Trypan blue and Congo red on the heart and blood pressure of frogs. Eugeniusz Młotkiewski (Univ. Poznań, Poland). *Intern. Arch. Allerg.* 1950 and 1951. *Immunol.* 1, 274-84 (1950). Trypan blue and Congo red in intravenous doses of 0.08 or 0.1 g./kg. have no effect on the rate, rhythm, or height of contraction of the frog heart, nor do they affect the arterioles or capillaries of the lung and mesentery. With 0.4 g./kg. only slight changes in heart and tissue reactions were noted. It therefore seems possible that the severe shock seen in dogs after intravenous injection of 0.1 g./kg. is not caused by a direct effect of the dyes on the vasmotor system. Himer L. Becker

The influence of trypan blue and Congo red on the heart and blood vessels of the frog. Eugeniusz Mietkiewski (Univ. Poznań, Poland). *Intern. Arch. Allergy Applied Immunol.* 1, 274-84(1950).—Electroneg. dyes, such as trypan blue and Congo red, in a dose of 0.1 g./kg. given intravenously, cause in dogs, immediately following injection, a severe shock with sudden fall in blood pressure and other symptoms characteristic for anaphylactic shock. The same doses of trypan blue and Congo red have no effect on the strength and rate of heart beat in frogs and on the caliber of mesentery blood vessels. It is probable that shock in dogs produced by the dyes is not due to a direct effect on circulation but is the result of biochemical changes produced in the so-called shock organs, chiefly the liver, whereby active substances, among which is histamine, are liberated.

AUTHOR: Maslowski, J.; Mietelski, J.

TITLE: The moon's physical libration in longitude and Mathieu's equation

SOURCE: Acta astronomica, v. 13, no. 2, 1963, 135-141

TOPIC TAGS: lunar physical libration, Mathieu equation, lunar libration, physical libration, libration

ABSTRACT: A new expansion of the moon's physical libration in longitude (τ) is given. The result is obtained by replacing integration of a simple second-order differential equation with constant factor by a solution of the corresponding differential equation of Mathieu's type. The coefficients of the expansion obtained for τ as a function of the time are given in algebraic form, and the existence of new singular points of the expansion is signalized. "In concluding the authors wish to thank Prof. Dr. K. Koziel for drawing their attention to the topic, for reading the manuscript, and for his valuable remarks."

Abstract: Authors tested the Karinowski method for argentometric
determination of barbiturates in alkaline, semi-aqueous
solution on a semi-microscopic scale on the two antiepileptic
drugs (both Polfa), and describe the procedure. The findings
are reported in three tables, and conclude that this is a
convenient, rapid, economical, and accurate method of deter-
mination, especially with respect to Phenyltoin. There are

production which cannot be described by the theories based on the direct model. The experimental status of the problem is described. The author then goes on to discuss multiple production in the range of cosmic ray energies, and arrives at the following conclusions: (1) The phenomenon of multiple production cannot be described by the statistical model of a single excited structureless volume in a form which does not differentiate primary baryons; (2) The fundamental feature of multiple production in the accelerator energy range is the creation of transient intermediate states which dissociate into π -mesons; (3) It is possible that in addition to the baryon-free resonances such as ω , η , or ρ , found and adequately defined in the last two years, larger baryon-free systems (the so-called fireballs) are created in collisions involving the highest energies; (4) Thus far, there is no theory to account for either the resonances or the fireballs. Orig. art. has: 7 figures and 1 table.

AUTHOR: Miesowicz, Marian

TITLE: Particle production in collisions of high- and ultrahigh-energy nucleons

SOURCE: Postepy fizyki, v. 15, no. 2, 1964, 141-153

TOPIC TAGS: Multiple particle, nucleon, meson, baryon, pion, strong particle interaction, weak particle interaction, multiple meson production, hyperon, particle collision, strangeness, meson jet, fireball

ABSTRACT: The paper is primarily devoted to a review of the problem of the existence of intermediate states in the production of π^- mesons within the framework of the phenomenon of multiple production, characterizing strong interactions. Two fundamental models of multiple production are considered: the model of direct or independent production, also termed the statistical model, and the model of production via intermediate stages. The author attempts to show that there exists a large group of recently discovered forms of multiple
