TITLE Production of self extinguishing chlorine-containing polyester resins using unsaturated organophosphorus compounds.

SOURCE: Plasticheskiye massy*, no. 2, 1964, 12-16

TOPIC TAGS: polyester resin, flameproofing, self extinguishing polyester, fire resistant fiberglass, chlorine containing polyester, vinylphosphonate polymer, phosphorus containing polyester, polyester resin curing

ABSTRACT: Fire-resistant binders for fiber glass can be obtained from a chlorine-containing polyester resin, di- β , β' -chlorethyl ester of vinylphosphonic acid, and polyesters based thereon. Hardening of the chlorine-containing polyester resins by adding organophosphorus compounds at room temperature in the presence of various initiator systems was studied. The system, consisting of unsaturated polyester, styrene, and polyester based on the di- β , β' -chlorethyl es-

1/2

Card

ter of vinylphosphonic acid, hardens at 20C in presence of benzoyl peroxide and dimethylaniline. The phosphorus-containing polyester reacts through the double bond of the vinyl group, forming insoluble 3-dimensional products. Fire-resistant fiber glass having excellent physical-mechanical properties can be obtained by using a highly unsaturated polyester resin in conjunction with the di- β , β' -chlorethylester of vinylphosphonic acid or polyesters based thereon; better properties are attained with the organophosphorus polymer. TITLE: Some reactions of the hemiacetal terminal groups of acetaldehyde polymers

SOURCE: Khimicheskiye svoystva i modifikatsiya polimerov (Chemical properties and the modification of polymers); sbornik statey. Moscow, Izd-vo Nauka, 1964, 102-105

TOPIC TAGS: acetaldehyde polymer, trimethylbromomethane, triphenylchloromethane, acrolein, allyl alcohol, acrylonitrile, isoprene, infrared spectroscopy, hydroxyl group, hemiacetal group, polyaldehyde

ABSTRACT: In order to clarify the effect of different terminal groups in acetaldehyde polymers on the stability of these polymers, the reactions of the hydroxyl terminal groups in these polymers with acetic anhydride, trimethylbromomethane, triphenylchloromethane and some unsaturated compounds (acrolein, allyl alcohol, acrylonitrile, isoprene) were investigated. The amorphous acetaldehyde polymer was obtained by polymerization of the aldehyde at -78°C, in the presence of aluminum oxide. The preparation and acetylation of the polymer and other reactions are

Cord 1/3

L 34141-65

ACCESSION NO: AT4049846

15 3

described in detail. The intrinsic viscosity and thermal stability of the polymers were determined and tabulated data show, for the reaction with acetic anhydride, that polymers with acetylated terminal groups are more stable than the initial polymers. Optimum results were obtained by acetylation at 20C for three days. At 20C the molecular weight of polyacetaldehyde remains almost unchanged and the polymer undergoes no degradation. The infrared spectra of the acetylated polymer showed a sharp band at 1720 cm^{-1} characteristic of the C=O group. The bands characteristic of hydroxyl groups were missing. The reactions with trimethylbromomethane and triphenylchloromethane showed that the hydroxyl groups are substituted by ether groups. Polymers with these end groups (where R = CH_3 or C_6H_5) are more stable than the initial polymers; trimethylbromomethane gives a more stable polymer than triphenylchloromethane. Infrared spectra show bands characteristic of $(\text{CH}_3)_2\text{C}$ groups over the region of about 1250 cm^{-1} (trimethylbromomethane) and of C_6H_5 groups at 3040 cm^{-1} (triphenylchloromethane). It was established that hemiacetal hydroxyl groups react readily with unsaturated compounds, as confirmed by IR spectra. The best results were obtained with acrolein. Tabulated data show that by precipitating the polymer from acetone solution with sodium bicarbonate, its stability is increased. The stabilizing effect of Na

Card 2/3

L 3414*-65
ACCESSION NR: AT4049846

bicarbonate is explained by the fact that it binds the acetic acid present in the polymer and thus prevents the subsequent acid decomposition of the polymer. However, this stabilizing effect is found only until, during depolymerization from the end of the chain, the equivalent amount of acetic acid is formed, for the neutralization of which all the sodium bicarbonate adsorbed by the polymer is used up. The substitution of the hemiacetal hydroxyl terminal groups of acetaldehyde polymers by CH_3COO , $(\text{CH}_3)_3\text{Co-}$, $(\text{C}_6\text{H}_5)_3\text{CO-}$ and $\text{RCH}_2\text{-CH}_2\text{O}$ (where $\text{R}=\text{CHO}$, CH_2OH , CN and $\text{CH}=\text{CH}_2$) groups increases the thermal stability of these polymers considerably. Orig. art. has: 3 tables and 4 formulas.

TITLE: Properties of unsaturated polyesters of 1,2-propylene glycol and of transparent plastics based on them.

CITED SOURCE: Vestn. tekhn. i ekon. inform. N.-i. in-t tekhn.-ekon. issled. Gos. kom-ta khim. prom-sti pri Gosplane SSSR, vyp. 6, 1964, 16-18

TOPIC TAGS: unsaturated compound, polyester plastic, propylene glycol, transparent plastic

TRANSLATION: The properties of polyesters based on 1,2 polypropylene glycol and various quantities of maleic and phthalic anhydrides were studied as well as those of transparent plastics manufactured from these polyesters. In addition to the polyesters, the binder for these plastics contains styrene in various quantities as well as hardeners. When an initiator system of isopropyl benzene hydroperoxide and cobalt naphthenate, the resin hardening process took 21 days, while the use of

Card 1/2

L 48569-55

ACCESSION NR: AR5009908

methylacetyl ketone peroxide shortened it to 7 days. The optimum content of styrene in the binder was ~40%. It was found that the thermal stability for copolymers of polyesters with styrene increases with the non-saturation of the polyester, while the hardness and compressive strength of these copolymers simultaneously decreases. When the non-saturation of the polyester is low, the water resistance of the composition products is poor. The strength and bending module of elasticity for transparent plastics with a binder based on polypropylene glycol maleatephthalate were higher than those for plastics based on polypropylene glycol maleatephthalate. How-
ever, the latter composition yields a transparent plastic with strength at high tem-
peratures.

TITLE: Thermooxidative reaction of unsaturated polyesters

SOURCE: Plasticheskaya prom., no. 6, 1965, 6-7

TOPIC TAGS: polyethylene glycol ester, maleic acid ester, succinic acid ester, phenoic acid ester, polyhydrophthalate, unsaturated polyester, polyester degradation, thermo-oxidative degradation, styrene copolymerization, cyclohexanone peroxide, cobalt naphthenato, polyester hardening

ABSTRACT: The following polyesters were studied: polydihydroxyethylene glycol maleate succinate 1:0:0.5:0.5 (polyester I), polyethylene glycol maleate diphenate 1:0:0.5:0.5 (polyester II), and polyhydrophthalate 1:0:0.4:0.6 (polyester III). The polyesters were also hardened by copolymerization with styrene in the presence of a reducing system of cyclohexanone peroxide and cobalt naphthenato. The oxidation kinetics of the polyesters were followed by measuring the change in the gas pressure in the system. The thermal oxidation of the non-hardened polyesters is characterized by a substantial evolution of gases which begins at 130°C and increases markedly with rising temperature and initial oxygen pressure.

Cord 1/2

L 54068-65
ACCESSION NR: AP5012100

Appreciable induction periods were observed in the oxidation of the hardened and non-hardened polyester resins. Polyester III was studied in a circulation device which made it possible to freeze out the degradation products and determine the thermal oxidation kinetics only from the absorption of oxygen in the system; induction periods were observed at the end of which the reaction entered autocceleration. This indicated a radical-chain mechanism proceeding with d - branched branching. The oxidation of a styrene hardened solution of polyester III to which organic stabilizers had been added also indicated this mechanism. The influence of various initiators used for the hardening of unsaturated polyesters was manifested only at high temperatures (about 250°C). The products of the thermal oxidation of polyester III were identified. Orig. art. has: 7 figures and 1 table.

TITLE: Properties of fiberglass reinforced plastics of high transparency

SOURCE: Plasticheskiye massy, no. 6, 1985, 62-64

TOPIC TAGS: fiberglass reinforced plastic, transparent plastic, glass filler, sizing agent, binder, polyester resin, polymer stability

ABSTRACT: The authors studied the influence of various types of glass fillers, sizing agents, and binders on the light transmission and properties of highly transparent fiberglass reinforced plastics. In the preparation of the latter, PNM-8 and PNM-2 polyester resins were employed. A study of light transmission made with a spherical photometer showed that the presence of a paraffin or polyvinyl acetate sizing agent decreases the transparency of the material in all cases, regardless of the filler used, whereas the presence of glass cloth increases it considerably. The use of a glass mesh of loose structure is highly recommended, particularly if its paraffin content is low. The light transmission also depends on the curing system employed and it decreases in the following order of such systems: cyclohexanone peroxide + NK accelerator; methyl ketone peroxide + NK accelerator; benzoyl peroxide + dimethylaniline. The

Card 1/3

L 58975-5

ACCESSION NR: AP5014698

stability of the fiberglass reinforced plastics to water, light, and the atmosphere was also studied. It is concluded that the plastics prepared by using PNM-8 and PNM-2 resins are characterized by a high transparency (70-80%), good physicomechanical properties, and a satisfactory resistance to the effect of the atmosphere and light, and can be used as transparent panels in construction. TITLE: Copolymerization of unsaturated polyesters with different monomers

SOURCE: Plasticheskiye massy, no. 6, 1966, 19-21

TOPIC TAGS: polyester plastic, copolymerization, polymerization catalyst, heat resistance, hardness, vanadium pentoxide, monomer

ABSTRACT: The effect of vanadium pentoxide as an accelerator in an oxidation-reduction curing system for the copolymerization of unsaturated polyesters with different monomers was investigated. The study was conducted using resins based on polyethylene glycol maleinate hexachloroendomethylenetetrahydrophthalate blended with polyester acrylate TMG-3 or with polydiethylene glycol maleinate phthalate. Resins were cured with cumene hydroperoxide (C) and 0.25 and 0.5% solutions of V_2O_5 in acid phosphate (accelerator B). The gelling rate was affected much more by change in concentration of B than of C. Gelling with C + B started in 1-3 hours in the polyester samples; the corresponding

Card 1/2

ULC: 678.674'4'0 = 9:678.744] :678.044.8

L 38508-66

ACC NR: AP6018123

induction period at room temperature for C+NK (Abstractor's note--NK not defined, probably cobalt naphthenate) was several days. The C+B system gives a harder, more heat stable lightly colored non-sticky glassy product. If resins made with C+B are heat treated for 3 hours at 80°C their hardness and heat stability are higher than for room temperature cure. Gel formation is slowed down in a 3-component system of C+B+NK. Optimum hardness and heat stability are obtained if about 0.5 parts by weight of NK is used per 100 parts of resin. Unsaturated polyesters can be cured at room temperature with systems containing V₂O₅; resultant resins have improved properties. Orig. art. has: 8 figures and 1 table.

TITLE: Moisture resistance and chemical stability of unsaturated polyester resins
modified with colophony

SOURCE: Plasticheskiye massy, no. 9, 1966, 40-42

TOPIC TAGS: solid mechanical property, polyester plastic, synthetic material, physical chemistry property, stability constant

ABSTRACT: Moisture resistance and oxidation stability of two commercial resins modified with colophony, resin PN-10-a copolymer of an unsaturated ester with styrene and resin TGM-3- (a copolymer of an unsaturated ester and polyacrylate) and some glass laminates based on these two resins were investigated. The physical properties of the colophony-modified resins are tabulated. The tensile strength of the colophony-modified resins and the glass-laminates based on them was practically unaffected after holding in water or 25%-sulfuric acid for 7-360 days. In general, the addition of colophony was found to be beneficial with respect to water resistance and chemical stability of the unsaturated polyester resins. Orig. art. has: 1 figure and 3 tables.

TITLE: A study of the properties of polyethyleneglycolmaleate diphenates and of the glass textolites based on them

SOURCE Plasticheskaya massa*, no. 11, 1964, 19-21

TOPIC T AGS: fiberglass, glass textolite, polyethyleneglycolmaleate, diphenic acid, amine

ABSTRACT: The properties of polyethyleneglycolmaleate diphenates and the glass textolites made from them were investigated, using polyester resins based on ethylene-glycolmaleate diphenate with different proportions of acid reagents in the formula, obtained by polycondensation in a melt. The reaction was carried out at 200°C until an acid number of 33-35 was obtained. The beginning of polycondensation was noted at 140-150°C; the reaction time was 9-15 hrs. depending on the ratio of the acid reagents. The synthesized polyesters were solid, brittle, brown products. Their characteristics are tabulated. The polyesters are characterized by a good compatibility with styrene in a ratio of about 25:75. The temperature dependence of the viscosity of the styrene solution of polyethyleneglycolmaleate diphenate showed a hyperbolic character and could be plotted.

Card 1/2

B

L 14509-5

ACCESSION NR: AP4048204

calculated from a general equation. It is shown that the viscosity of three types of resin decreases with increasing temperature to the same extent: $n = 2.51 - 2.59$. These solutions readily harden at room temperature with different redox systems. They have a slightly higher brittleness than glycolmaleate phthalate, but a lower shrinkage and better heat stability (at a higher degree of unsaturation). Their waterproofness is determined by the density of cross-linking and the content of aromatic components. The diphenates have a higher moisture resistance than the adipates of similar structure. The use of these resins as binders for glass textolites gave better mechanical and insulating properties than that of the usual resins. Tabulated data show that at higher temperatures, the loss in bending and compressive strength of these materials is less than for materials based on adipate and phthalate. It can be concluded that unsaturated polyester resins based on diphenic acid can be used for making high-strength and heat-stable glass textolites. Orig. art. has: 5 figures, 3 tables and 1 formula.

Abstract : In patients with general epilepsy, with grand and petit
attacks, the development of differentiated retardation
was delayed, it was unstable, and subsequent retardation
was observed; with the use of inhibited conditioned stimulants,
the well-developed conditioned reflexes dropped
out, the latent period of reaction increased. The impairment
of the interaction and mobility of primary processes
affect not only the cortex but also other sections of the
CNS.

TITLE: Microfaunistic investigations of the Albion in North-western Bulgaria

SOURCE: Bulgarsko geologichesko druzhestvo. Spisanie, v. 27, no. 1, 1966, 39-50

TOPIC TAGS: paleontology, geology

ABSTRACT: Drilling expeditions were conducted in connection with microfaunistic investigations of the region between the village of Rabisha and the Iskar river in North-Western Bulgaria. The study covered the entire profile of the Albion period and compared it with findings on the surface. It turned out that the Olenseissian horizon comprising the H. bigoureti, the Nolani Zone, and the Jacobi Zone of the lower Albion can be examined layer by layer. The Nolani Zone has a monotonous and poorer foraminifera assemblage with a prevalence of agglutinated shells. New species with an abundance of planktons appear in the Jacobi Zone. There is again a sparsity of fauna in the Tardifurcata Zone. The Middle Albion - the Dentatus Zone - is almost deprived of foraminifera and contains only fish remains. Plankton foraminifera of the family Globigerinidae and radiolaria are chiefly found in the Upper Albion - the Orbignyi Zone.

Study of the growth of gallium phosphide and cadmium telluride
on the gallium arsenide substrate by gas transport reaction

SOURCE:

Fizika tverdogo tela, v. 6, no. 8, 1964, 2353-2357

TOPIC:

AGS: gallium phosphide, cadmium telluride, gallium phosphide
film, cadmium telluride film, thin film growing, film growing

ABSTRACT:
Card 1/

The epitaxial gallium phosphide and cadmium telluride films
were grown on the gallium arsenide substrate by using transport reac-
tion in the gaseous state and iodine as the transporting medium in ampuls
evacuated to approx 10 mm Hg. Almost all the films were single
crystals with mirror-like surfaces. The rate of the film growth was
found to depend on the source (gallium phosphide or cadmium telluride)
temperature only (not on the substrate temperature) and to vary from
2 whr at 1020K to 4.5 μ /hr at 1090K source temperature. The type of
conductivity of the film was the same as that of the substrate. The

"Zhur Obshch Khimii" Vol XVIII, No 9

Investigates fusibility diagrams of 16 binary systems. Shows that arsenic trichloride with aniline and 1,3,4-xylidine gives high-melting compounds of composition $AsCl_3 \cdot 3C_6H_5NH_2$ and $AsCl_3 \cdot 3(CH_3)_2C_6H_3N_2$. Stannic tetrachloride with o-nitroanisole forms a compound of equimolecular composition, $SnCl_4 \cdot O_2C_6H_4(NO_2) \cdot O_2CH_3$. The remaining systems, except arsenic tribromide-azobenzene, are mechanical mixtures in the crystalline state. A second, modification of bismuth tribromide exists with transition temperature of 151°. TITLE: Use of lagochylus in acute radiation sickness induced by polonium-210

SOURCE: Meditsinskaya radiobiologiya, v. 9, no. 6, 1964, 43-46

TOPIC TAGS: lagochylus therapeutic effect, unithiol, radiation sickness, polonium-210, blood coagulation, capillary permeability, capillary fragility

ABSTRACT: The therapeutic effect of lagochylus, a styptic preparation, on capillary fragility and permeability in acute radiation sickness was investigated in 120 mice, 170 rats, and 8 dogs. Radiation sickness was induced in the animals with single subcutaneous polonium-210 injections (0.1 mc/kg for mice, 0.05 mc/kg for rats, and 0.06 mc/kg for dogs). Lagochylus preparations in the form of a 1% water fusion or a 5% tincture were administered daily for 10 days after irradiation. In additional tests lagochylus preparations were combined with unithiol (5% water solution) and administered twice.

Card 1/2

L 6989-15
ACCESSION NR: AP4040837

daily 100 mg/kg single dose) for 3 or 6 days after irradiation. Fragility and permeability of skin capillaries and blood coagulation time served as indices. Results show that in acute radiation sickness lagochylus preparations produce a favorable effect on permeability and fragility changes in skin capillaries, but do not prolong survivability of animals. Lagochylus is most effective when combined with unithiol, which facilitates polonium excretion. Lagochylus combined with unithiol moderates the course of acute radiation sickness and increases survivability. Orig. art. has: 4 figures.

Carotene in medicinal muds of U.S.S.R. B. G. Savinov,
A. A. Mikhaylovnina, and S. A. Shapiro (Inst. Org. Chem.,
Acad. Sci. Ukr. S.S.R.). Doklady Akad. Nauk S.S.R.
72, 1087-9 (1950).—Carotene analyses of medicinal muds
from various locations in the Ukraine were performed
(EtOH extr., followed by Caffe-petr. ether). The values
found for various locations ranged from 0.18 to 8.33 mg.
% (on dry wt.); highest value was found in Repoz
lake near Slavyansk. The presence of HgS apparently
serves to stabilize carotene content in these muds. Total
amps. of unassimilable pigments ranged from 0.9 to 5.7
mg. % (wet wt.). Unidentified pigments having absorp-
tion max. at 500 and 487 m μ were also found in the course
of chromatographic sepa. G. M. Kasolapoff

7. Stability of carotene to alkali. A. A. Mikhaylovnina and
Yu. G. Savchenko. *Ukrain. Khim. Zhur.* 17, 490-93 (1961)
(in Russian).—Treatment of α - or β -carotene in C₆H₆ with
10% KOH (5–10%) in the absence of light and O does not
alter the resistance to storage of the substances after ex-
tended periods even at elevated temp. The changes which
take place consist of partial decompn., forming colorless
substances, as well as stereoisomerization. Under mild
conditions the formation of di-cis isomers predominates at
first: neo- α -carotene II and neo- β -carotene II, resp. At
elevated temp. are also formed in smaller amt. neo- α -
carotene U and neo- β -carotene U (Cf. Beadle, *et al.*, *C.A.* 56,
5836^a and Zechmeister and Tuzson, *C.A.* 32, 9129^b).

Some transformations of carotene in acid medium.
A. A. Mikhailovina and E. G. Savinov. Ukrains. Khim. Zapor. No. 39-40 (1953).--In an inert atm. carotene is not attacked by 10-40% HCl or H₂SO₄. In the presence of atm. O₂ oxidative destruction of the pigment occurs rapidly and the process is accelerated by rise in temp. Chromatographic analysis of the products showed that in inert atm. the acid medium leads to formation of stereoisomers of α - and β -carotene with predominant formation of mono-cis isomers; the amount of di-cis isomer which forms on mere contact with the solvent is not affected by acids. The oxidative attack produces the known oxidation products.
G. M. Kosolapoff

MIKHAYLOVINA, A. A.

Organic Chemistry

Neo-*S*-carotene as the product of primary stereoisomeric transformation of *S*-carotene on heating. It is well known that *S*-carotene undergoes thermal isomerization. Bellamy (1941) and K. A. Almquist (1942) found that *S*-carotene was isomerized on heating in an inert atmosphere, and the products were chromatographed on Al_2O_3 . The conversion is measured by light transmission, and after 2 hrs. at 100° there is produced 24.2% new product which forms a lower blue-yellow chromatographic zone. The development by 1:2 Cetole-pet. ether, then by the latter alone, is satisfactory. The product gives 2 absorption max. 475 and 445 m μ , and is apparently an isomer. Called neo-*S*-carotene B. It shows a vis-peak at 370 m μ . Its formation is an equilibrium reaction, the big yield at 100° being reached at 3-5 hrs. (28.5%), at higher temps. it is broken down considerably, yielding colorless materials. It can be isolated in solid state by long standing of its petr. ether soln. in the cold; some 12.5% yield can be attained. It is deep red, m. 165°, and forms square plates from Cet. It is a direct isomer, as shown by the 9-11 m μ shift of its absorption max. relative to that of the initial trans-*S*-carotene. The absorption max. in various solvents are: petr. ether 475, 415, *tert*-Butane 476, 443, Cetole 490, 468, EtOEt 476, 444, CHCl_3 , 485, 452 m μ .

Title : Reaction of fumaric and maleic acid esters with allyl halide and Mg
Synthesis of cis- and trans-form 4,7-diallyldecatriene - 1,5,9-diol-
4,7

Periodical : Dok. AN SSSR 97/5, 831-833, August 11, 1954

Abstract : Experimental data on the synthesis of cis-and trans- 4,7-diallyl-decatriene-1,5,9-diol-4,7, are presented. The trans-form of the given glycol (diol) was obtained through the reaction of ethyl fumarate with allyl chloride and magnesium in an absolute ester medium. The cis-form of the glycol was derived from the reaction of ethyl maleate with allyl bromide and magnesium in an absolute ester medium. Data on the hydroxyl groups, molecular weight, density and bromine number of the synthesized glycol, are included. Six references: 3-USSR; 2-USA and 1-French (1899-1952).

Title: On the Monomethylation of Xylene

Original

Periodical: Ukr. khim. zh., 1956, Vol 22, No 1, 84-87

Abstract: The conditions for the preparation of pseudocumene (I) from xylene (II) have been investigated. The methylation of II with CH_3Cl for 12-25 hours in the presence of anhydrous Al_2Cl_3 at 80° gives I in yields of 30-38% (based on II charged). The separate methylation of the isomers of II produces no advantage compared to the methylation of the mixture; I and mesitylene are formed in both cases. Mesitylene and II are obtained by the hydrolysis with 20% HCl (30 minutes) followed by steam-distillation for 90 minutes at $80-90^\circ$, of the sulfonic acids formed when the fraction of alkylated products boiling at $150-180^\circ$ is sulfonated with an equal volume of concentrated H_2SO_4 .
