Title : Oleaceous Plants Cultivation in USSR

Orig Pub : Vestn. s.-kh. nauki, 1957, No 10, 67-74

Abstract : This is a review of oleaginous crop sowings in USSR over the last 40 years and of main scientific achievements in the field of cultivation of these plants. All areas are now sown with high quality varieties of Soviet selection and 229 new varieties are being tested on State-variety-sectors. The All-Union Institute of Oleaceous Crops and other experimental institutions develop and put into production the correct agricultural engineering and mechanization of

AUTHOR: Zimina, L. N.; Minkevich, I. A.

TITLE: Effect of cold-work on the structure and properties of KhN67VMTYu alloy Bt1

SOURCE: Moscow. Tsentral'nyy nauchno-issledovatel'skiy institut chernoy metallurgii. Sbornik trudov, no. 39, 1965. Spetsial'nyye stali i splavy (Special steels and alloys), 224-227

TOPIC TAGS: alloy steel, metallographic examination, mechanical property, physical metallurgy, cold working, cold rolling, aging process, heat treatment/KhN67VMTYu steel

ABSTRACT: The influence of plastic deformation on the precipitation behavior of supercooled Cr-Ni solid solutions was studied. The alloy was tested in the 600-1000°C temperature interval after receiving varying amounts of cold work to reductions of 50%. The alloy was induction melted, and had the following chemical composition: base-Ni 17.5% Cr; 4.8% Mo; 4.6% W; 2.8% Ti; 1.0% Al; 0.05% C. It was then reduced to a rod diameter of 8 mm, and annealed at 1170°C in air. The rods were then pickled in an acid solution and reduced 10, 20, 30 and 50%. Mechanical properties and metallography were done on the samples immediately after cold work

Card 1/2

L 59627-65

ACCESSION NR: AT5016069

and after aging. The mechanical properties of the alloy increased with increase in cold work. After subsequent aging in the 600-850°C interval, three separate regions could be distinguished for strength plotted as a function of aging temperature. The location of maxima and minima on the curves depend on the aging temperature, holding time, and degree of prior cold work. It was concluded that cold plastic deformation intensifies the processes of dispersion hardening in the alloy and contributes to the segregation of the strengthening phase both within the grain, as well as along the grain boundaries, slip lines, and twin boundaries. TITLE: Diagnosis of vascular mycosis in oak

SOURCE: Lesnoye khozyaystvo, no. 11, 1965, 58-59

TOPIC TAGS: plant injury, luminescence spectrum, UV irradiation

ABSTRACT: The investigations attempted to establish criteria for the detection of vascular mycosis in its early stages by analysis of amount, color, acidity, concentration, and luminescence of the sap. Three categories, varying from 30-60% in dryness, and sap loss in healthy and diseased oak were observed according to the M. G. Khanislamov method (1958). Sap quantity was determined by employment of an oil press manometer for 3-5 min at 200 kg/cm². The material was cleansed of bark and placed in a brass container. Concentration was estimated in paper filtered sap by a field refractometer adjusted to the saccharose percentage scale. The tested categories exhibited various degree of luminescence, from light-grey in health oak, to violet in diseased oak. The preparation was then dried and irradiated with UV. These findings made it possible to detect infection foci. The author concludes that the luminescence test

0
0

The author continues the study of one-parameter systems of set-valued transformations which he began in an earlier paper [same Doklady (N.S.) 59, 1049-1052 (1948); these Rev. 9, 449]. Let R be a compact metric space with metric ρ . Let C be the collection of all nonvacuous closed subsets of R and let C be metrized by the Hausdorff metric, say σ . Let $S: R \times T \rightarrow C$, where T denotes the set of real numbers. Assume that (1) if $p \in R$, then $S(p, 0) = p$; (2) if $p \in R$ and if $t, s \in T$ with $t \leq s$, then $S(S(p, t), s) = S(p, t+s)$; (3) if $p, q \in R$ and $t \in T$ with $q \in S(p, t)$, then $p \in S(q, -t)$; (4) the function $S(p, t)$ ($p \in R, t \in T$) is continuous in t for each fixed p . A system of differential equations $x' = f(x)$ (x and $f(x)$ are n -dimensional vectors; $f(x)$ is continuous) defines a transformation S satisfying the above conditions.

Let T^+ (T^-) denote the set of nonnegative (nonpositive) real numbers. If $p \in R$, then the sets $S(p, T)$, $S(p, T^+)$, $S(p, T^-)$ are called the funnel, ω -funnel, α -funnel of p . A point p of R

Source: Mathematical Reviews, 1/2 Vol. 9 No. 7

8/2

6 6 No. 9 Vol 9 8/6/67

is called ω -continuous provided that if $t > 0$ and if $\epsilon > 0$, then there exists $\delta > 0$ such that $q \in R$ with $p(p, q) < \delta$ implies $\sigma[S(p, t'), S(q, t')] < \epsilon$ ($0 \leq t' < t$). The ω -funnel of $p \in R$ is called closed in case: (1) $S(p, T^+) = S(p, I)$ for some finite interval $I \subset T^+$; (2) if $q \in S(p, T^+)$, then $p \in S(q, T^+)$. A non-vacuous closed subset E of R is called ω -stable (in the sense of Poisson) provided that if $\epsilon > 0$ and if $t > 0$, then there exists $t' \geq t$ such that $\sigma[E, S(E, t')] < \epsilon$. A point p of R is called ω -recurrent provided that if $\epsilon > 0$, then there exists $L > 0$ such that $t', t'' \in T^+$ implies $\sigma[S(p, t'), S(p, t'' + t)] < \epsilon$ for some t with $0 \leq t \leq L$. A point p of R is called ω -periodic provided that $S(p, t) = p$ for some $t > 0$. The notions of ω -continuity, closedness of an ω -funnel, etc., are defined dually.

The following theorems, together with their duals, are announced without proof. (1) If $p \in R$, if the ω -funnel of p is closed and if $t \in T^+$, then $S(p, t) \subset S(p, t+t')$ for some $t' > t$. (2) If $p \in R$ and if the ω -funnel of p is closed, then $S(p, t)$ is a periodic function of t for sufficiently large t . (3) If $p \in R$, if $t \in T^+$ and if each point of $S(p, t)$ is ω -continuous and ω -stable, then $S(p, t)$ is ω -stable for all $t' > t$. (4) If $p \in R$ and if p is ω -recurrent, then $S(p, t)$ is ω -stable for all $t \in T^+$. (5) For a dynamical system within the plane (unique solutions not necessary) every ω -stable point is ω -periodic. (6) If $p \in R$, if every point of $S(p, T^+)$ is ω -stable, if $q \in S(p, T^+)$ and if q is ω -periodic, then $S(q, t)$ reduces to a point for all $t \in T^+$. (7) If $p \in R$ and if p is ω -periodic and ω -periodic, then the ω -period of p and the ω -period of p are equal in absolute value.

generate such a type of dynamical system. ϕ_0 is a point of continuity if $S(\phi, t)$ is continuous at ϕ_0 as a function of ϕ in the sense of Hausdorff metric. $S(\phi, t)$ is called positively stable in the sense of Poisson if given $\epsilon > 0$, $T > 0$, there is a $t_0; T$ such that $d(S(\phi - \epsilon), S(\phi, t + \epsilon)) < \epsilon$ (in particular ϵ may be 0 and then we speak of stability of the point ϕ). T_0 is positively recurrent if given $\epsilon > 0$ there is an $t_0 > 0$ such that for any $t', t'' > 0$ there is a $r, 0 \leq r \leq t_0$, such that $d(S(\phi, t'), S(\phi, t'' + r)) < \epsilon$. Theorems: if $S(\phi, t_0)$, $t_0 \geq 0$,

~~(S(p,t)) = S(p,t')~~ Theorems: if $S(p,t), t \geq 0$ consists of points of continuity and is positively stable, each $S(p, t); t \geq t_0$ is positively stable; if T_+ is positively recurrent, each $S(p, t), t \geq 0$, is positively stable. For each $q \in T_+$ define $t_* = \inf\{t: q \in S(p, t), t \geq 0\}$; T_* is called positively closed if the set $\{t: q \in T_+\}$ is bounded and if for each $q \in T_+$ there is a (smallest) $t_0 \geq 0$ such that $p \in S(q, t_0)$. it may be shown that the set $\{t: q \in T_+\}$ is also bounded. Theorems: for each point q of a closed T_+ belonging to a dynamical system generated by a differential system there is a trajectory from q to p which does not coincide with any of the trajectories from p to q .

Winkler, W. G.

If T_+ is positively closed, for each $t \geq 0$ there is a $t' \geq t$ such that $\sup_{t'' \leq t} p(t''|t)$; if T_+ is positively closed and $\varphi \cdot T_+$, T_+ is positively closed; if T_+ is positively and negatively closed and $\varphi \cdot T_+$, then $T_+ \circ T_+$; if T_+ is positively closed each $q \in T_+$ is an ω -limit point and each ω -limit point belongs to T_+ , assuming that the system is

Title: The Problem of Increasing the Therapeutic Effectiveness
of Gastrointestinal Bacteriophages.

Org-Pub: N. N. Nauk. Izdatelstvo, Moscow, 1971, 115-121.

Abstract: Of 337 alimentary cultures isolated in children who
were cited with chronic dysentry only 60 percent
proved to be sensitive to the usual standard phage(s).
The phage were adapted (to each culture individually).

Code: 1-1/2

No cultures selected for their biochemical and sero-
logical properties had affinity for their phage-resistant
strains. A mixture was made of these phage (polyphage)
and it was used for treatment. The treatment was given
in doses corresponding to the daily doses. Of
the children sick with chronic dysentery, who were given
such treatment, 35 (9.1-9%) were discharged healthy.
New persons (6.9%) remained chronic carriers. --

EXCERPTA MEDICA Sec. 17 Vol. 3/7 Public Health July 57

2224. MINKH A. A. Moscow *The present-day concept on the physiologic and hygienic significance of air ionization (Russian text)* Tezisy dokladov na XIII vsesoyuznom s'ezde gigienistov, epidemiologov, mikrobiologov i infektsionistov (Moscow) 1956, Kniga 1 (51)

Artificially ionized, negatively charged air, contrary to positive ions, has a beneficial influence on many physiologic functions of man and animals. Especially pronounced was this influence on the electro-chemical properties of blood, on the processes of tissue respiration and on the functional condition of the central and peripheral nervous system. Observations of many investigators have shown that overcrowding of people and poor ventilation cause a significant decrease of the numbers of light ions, and increase of heavy ions. The changes referred to occur parallel to the deterioration of general sanitary conditions of the air. The observable changes in the ionization condition of the air of the room give reason to assume an influence of these changes on the health of the people. They may serve as a criterion for determination of the air qualities and other hygienic purposes.

Problems in Health-Resort (Cont.)

SOV/6150

PURPOSE: This book is intended for physicians working at health resorts and for the general practitioner.

COVERAGE: This book, a collection of articles, is essentially the proceedings of the Second Conference on the Physiological Effect and Therapeutic Application of Air Ions, held at Riga (Latvian SSR) in December 1957. The use of negative air ions is believed to be beneficial in the treatment of nonhealing wounds and ulcers which often result from radiation injury. The book contains photos of numerous devices described in the text. Numerous references, mostly Soviet, are given at the end of some of the articles.

TITLE: Investigation of high-boiling distillates of Arlanskiy petroleum

CITED SOURCE: Tr. Bashkirsk. n.-i. in-t po pererabotke nefti, vyp. 5, 1962, 250-259

TOPIC TAGS: distillates, petroleum

TRANSLATION: A study was made of a sample of petroleum from the Arlansk oil field (in northern Bashkiria), having the following characteristics: σ_{20}^{20} 0.893, viscosity 10.9 centistokes/50°, coking capacity 7.7%, S content 3.1%, paraffin content 4.7%. The petroleum was distilled in an experimental tubular unit, yielding 68.4% mazut boiling

Card 1/2

ACCESSION NR: AR3000209

above 300°. Rectification of the mazut in vacuum yielded 4 fractions of distillate (listing of boiling range of fraction in °C, yield in % on the basis of petroleum, viscosity index): 300-350, 8.1, 71; 350-400, 8.9, - ; 400-450, 6.2, 60; 450-500, 7.7, - ; in the residue were obtained 37% (on the basis of petroleum) of petroleum asphalt. Chemical type composition of vacuum distillates is given. It was found that Arlanskiy petroleum distillates boiling in the range 300-500° differ from analogous distillates of Tuymazinskiy petroleum by a higher content of aromatic fractions, in which predominate fractions of "heavy" and "benzene" aromatic compounds. From the recovered Arlanskiy vacuum distillates were obtained, by purification with phenol and deparaffinization in acetone-toluene solution, oils with a yield of 43-29.5% (on the basis of distillate), having a viscosity index 70-102 and S content of 0.8-2%. In stability to oxidation, these Arlanskiy oils are equivalent to Tuymazinskiy oils of equal degree of purification. The obtaining of power-machinery fuel oils from Arlanskiy distillates is possible only through the addition of a highly effective inhibitor to the purified oils. A. Ravikovich.

TITLE: Erection of pontoon bridges in the dark under floating ice conditions

SOURCE: Voyenny vestnik, no. 4, 1966, 90-93

TOPIC TAGS: ground force training, military engineering, *military bridge*

ABSTRACT: The conditions of crossing rivers during the spring-time thawing period are reviewed including the construction of pontoon bridges by military engineering units. It is recommended that the units be well trained for overcoming various obstacles caused by floating ice, thawing snow, floods, bad roads and wet, rough terrain. Various means for protecting pontoons and motor boats against the impact of floating ice are considered, and the use of various preventive devices and tools are recommended. The training exercises include reconnaissance operations, selection of crossing sites, transportation of pontoons and materials. Several versions of bridge construction under various ice conditions are examined. The ice conditions are investigated by a special reconnaissance squad provided with boats, rafts and other equipment needed for determining ice and slush conditions. The preparation of approaches to the bridge construction site is also discussed. Special attention is given to discussion of the night march of the engineering company.

Card 1/2

ACC NR: AP6023023

with its equipment and materials. The formation of the company column and the organization of the movement of vehicles on bad roads toward the river is discussed. The deployment of various units on the river bank, the use of light projecting equipment, the unloading of equipment and materials, the organization of intercommunications, the preparation of pontoons, boats and construction equipment for river works, and the construction of the bridge are reviewed. Various safety precautions for work in the darkness of night and under icy conditions are mentioned.

TITLE: Method of electrical control of the beam of an antenna array. Class 21,
No. 171034

25B

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 10, 1965, 45

TOPIC TAGS: antenna array, array beam control, beam control, waveguide antenna

ABSTRACT: With the proposed method, electrical control of the beam is realized by phase commutation of the hf radiators. To ensure reliable scanning by an array with an increased number of radiators, commutation is determined on the basis of the length of the switching interval according to the formula $A = B - C \sin \alpha$, where B and C are constant values for each specific antenna and α is the slope of the cophase front of the beam in relation to the plane of the array. The radiators are fed both in parallel and in series by the waveguide along which they are located.
