"Q Fever in the Azerbaydzhan SSP," by M. N. Sterkhova and M. M. Mirzoyeva, Azerbaydzhan Institute of Epidemiology, Microbiology, and Hygiene, Zhurnal Mikrobiologii, Epidemiologii i Immunologii, Vol 27, No 12, Dec 57, pp 84-88

The article describes investigations of cattle, sheep, and goats carried out in 1954-1955 to determine the possibility of their infection with Q fever. Cattle brought into meat combines from various regions of Azerbaydzhan, from milk farms of the Baku region, and from different private farms of Apsheron were examined. Agglutination and complement fixation reactions were performed in the investigations using antigen from R. burnetii, obtained from the Institute of Epidemiology and Microbiology imeni Gamaleya, Academy of Medical Sciences USSR.

Some 1,335 agricultural animals were examined in 1954. Table 1 [not reproduced] shows results of the agglutination and complement fixation reactions with sera of cows, sheep, buffaloes, and horses. Detection of Q fever in these animals inspired further study of ticks as natural virus vectors. Two species of Ixodes ticks, Hyalomma pl. plumbeum, and Boophilus calcaratus were collected from cattle in a meat combine. Guinea pigs were infected intraperitoneally with a ground tick preparation.

There is a discussion of the 1955 investigation of Q fever among persons whose work necessitated close contact with cattle, i. e., workers in meat combines, dairies, dairy farms, tanneries, a leather-rawhide base, and "Obuvshchik," Azmekhshuby, and "Voylochnik" artels. Results of serological examinations of various professional groups of the Baku population for Q fever are given in Table 2 [not reproduced]. Details of one case history are included in the text.

Results of all investigations carried out by the authors led to the following conclusions:

"1. The infectivity of cattle and small livestock in the Azerbaydzhan SSR was serologically established.

"2. Elimination of the virus in the milk of infected cows was established, proof of which was the presence of antibodies to R. burneti in the blood of guinea pigs infected with the milk of the sick cows, which was considered equivalent to isolation of the virus.

"3. The spontaneous infection of the *Hyalomma pl. plumbeum* ticks taken from cows with Q fever was established.

"4. Persons professionally in contact with cattle (workers of meat combines, tanning factories, milk factories, Azmekhshuby, etc.) were infected with the Q fever Rickettsia.

"5. A culture of Q fever Rickettsia was isolated from the dust of a room in the "Voylochnik" artel in which felt boots and cloaks were made of sheep's wool.

"6. Among febrile patients with an insufficiently clear diagnosis, 8.2% reacted positively in complement fixation and agglutination reactions with R. burneti.

"7. A considerable number of cases of Q fever occurred under other diagnoses, which indicates that medical workers are inadequately acquainted with the etiology, epidemiology, and clinical picture of Q fever.

"8. Our data demonstrate the presence of Q fever in Azerbaydzhan and the necessity of a comprehensive study of this disease throughout the Azerbaydzhan SSR by specialists in infectious diseases, epidemiologists, and microbiologists."

TITLE: A study of relationships governing the copolymerization of divinylbenzenes
 with styrene using the sodium salt of polyalkylbenzenesulfonic acid as an emulsi-
 fying agent

SOURCE: Azerbaydzhanskiy khimicheskiy zhurnal, no. 1, 1964, 37-42

TOPIC TAGS: copolymerization, emulsifier, polyalkylbenzenesulfonate, divinyl-
 benzene copolymer, styrene copolymer, ion exchange resin, cumene hydroperoxide

ABSTRACT: This work is a continuation of earlier investigations on the adoption
 of polyalkylbenzenes used for alkylation in the production of high-molecular-
 weight compounds. The article presents the results of a study of the relation-
 ships governing the copolymerization of styrene with the technical-grade fraction
 of divinylbenzenes, the best ion-exchange resins being obtained from such copoly-
 mers. The copolymerization was carried out in the presence of cumene hydroperoxide
 as the initiator, and the sodium salt of polyalkylbenzenesulfonic acid as the
 emulsifier, developed at the INKHP under the supervision of M. A. Ashimov. The
 investigated factors affecting the copolymerization process were the temperature,
 Card 1/2

L 18951-65

ACCESSION NR: AP4049422

the initiator and emulsifier concentration, and the duration of the experiment. The optimum values found were a temperature of 90C, a concentration of cumene hydroperoxide of 2%, a concentration of emulsifier of 0.5%, and a reaction time of 8 hrs. The highest yield of polymers was obtained at low concentrations of divinylbenzenes in the starting mixture. Orig. art. has: 3 figures and 3 tables.

MIRZOYEVA, Sh.A.

A new method of analysis of isomers of dialkylbenzenes.
Yu. G. Mamedaliev, I. O. Ismailov, Sh. Mirzoyeva, T.
Z. Zinalova, and Kh. M. Abdullayeva. *Doklady Akad. Nauk*
S.S.S.R. 163, 839-80 (1965).—The analysis of dialkyl-
benzenes by oxidation to diacid acids, followed by separa-
tion of the latter by differences in solubility, is unsatisfactory since
the para isomer follows the so-called meta fraction to a con-
siderable extent, while the ortho isomer is contaminated
with the meta isomer, as shown by careful exams. of the
corresponding fractions sep'd. by solubility in hot and cold H₂O.
An x-ray analysis of the diacid acid isomers was found to
yield quant. results in mixts. with an accuracy of 4-5%.
Mixts. of the 3 pure isomers were exam'd. with Fe radiation
by using photometric detn. of line intensities. The follow-
ing interplanar spacings were found (in Å.): o-C₆H₄(CO₂H)₂:
8.580, 4.988, 4.575, 4.119, 3.880, 3.864, 3.406; m-isomer:
8.040, 8.755, 8.423, 8.342, 8.970, 2.694; p-isomer: 8.365,
4.225, 8.614, 8.220, 8.055, 8.596, 3.215, 1.780, 1.520.

Orig Pub : Izv. AN AzS.S.R., 1959, No 4 25-31

Abstract : The available method of chemical separation of dialkyl-substituted benzenes are not accurate. The new method of analysis of dialkyl-substituted benzenes is based on comparison of intensity of the characteristic x-ray diffraction line of isomers of naphthalic acid. The method yields entirely satisfactory results.

Abstract : The biological activity of chernozems cultivated at a depth of 50 cm and of the same soils cultivated by the usual method at a depth of 25-30 cm was compared at the Shadrin Experimental Station (1953-1956). Samples were taken of soils that were in a fallow state and of those occupied by crops of spring wheat and vetch-oat mixture. It is shown that deep nonbanking cultivation of the soil activates the course of the microbiological processes in the soil. Conditions are created for the development of
