Abstract : Aside from their specific actions, antibiotics cause a number of side effects, namely: toxic effects on the nervous system, allergic reactions and the appearance of resistant strains of microorganisms. It is, therefore, recommended that when they are used a sensitivity test be performed, that they be used in combination, that they be used only where there are strict indications, and that new

"Fatal Gall-Stone Arrosion Hemorrhage Combined with Aneurysm of the Abdominal Aorta in a Patient with Myxedema."

Budapest, Magyar Sebészet, Vol XVI, No 3, June 1963, pages 185-191.

Abstract: [Authors' German summary modified] The case of a 67 year-old woman is reported. Over the years, compression symptoms of aneurysm of the abdominal aorta developed, later clinical signs of a chronic gall-stone disease were evident. Severe hemorrhagic anemia developed simultaneously with a large, movable resistance on the right side, in three instances. Later, hematemesis and melena exhausted the organism in spite of massive transfusions. On autopsy, the arrosion of the wall of the gall-bladder, due to irritation by two stones, was shown to be the cause of the hemorrhage. In the authors' opinion cholecystectomy should be performed if hemobilia is present indicating complications. 1 Hungarian, the rest Western references.

Budapest, Magyar Pszichologiai Szemle, Vol 20, No 1, 1963, pp. 120-129.

Abstract: This article is a report on the Conference of All-Russian Philosophers, Psychologists, Physiologists, and Psychiatrists, held in Moscow, 8-11 May 1962. The Conference was organized by the Medical Academy of the Soviet Academy of Sciences, The Pedagogical Academy of the RSFSR, and the Ministry of High-School and University Education [original-language versions of the Soviet institutional names not given]. FEDOSEYEV, P.N., Academician, presided. Thirteen lectures were presented; they were briefly reviewed. The text of the lectures and discussions were published by the Academy Publishing House (Akademiai Kiado) in Budapest under the title: "Philosophical Problems in the Modern Natural Sciences" (A Modern Termeszettudomanyok Filozofiai Problemai), in 1962. The volume has 870 pages.

"Changes in the Serum Penicillin-Level Values in the Course of Using Semi-synthetic Penicillins (Methicillin, Oxacillin)."

Budapest, Orvosi Hetilap, Vol 107, No 38, 18 Sep 66, pages 1787-1789.

Abstract: [Authors' Hungarian summary] The changes in the serum level of the new semisynthetic penicillins -Methicillin, Oxacillin-, in response to varying doses of the compound, were studied. It was determined that, the i.m. administration of 1 g Methicillin gave therapeutic levels of serum penicillin concentration in every case. The oral administration of 1 g Oxacillin every 4-6 hours also insured a therapeutic serum level concentration in every case. 7 Hungarian, 1 Western references.

The effect of ultrasonic waves on influenza virus. László Bertó, Beáta Molnár, and Károly Garay (Univ. Budapest, Hung.). *Kísérletes Orvostudományok* 3, 357-60 (1950).-- Expts. proved that a treatment with ultrasonic waves with a frequency of 275,000 cycles/sec. for 100 min. increased the hemagglutinating power of PR8 influenza A virus. The virus itself was not affected by this treatment, and its infective power and antigen properties remained intact.

A cytopathogenic agent was isolated from the stools of 60% of 65 patients with paralytic poliomyelitis; 85% of the strains were of type I, the rest of type II. Of 134 patients with aseptic meningitis, 19% yielded a virus; 54% of these strains were type I, 23% was ECHO and 23% were not identified. Verlinde - Leyden (L, 4)

(POLIOMYELITIS VIRUS

strains isolated in Hungary during epidemic of 1957 (Hun))

From the stools of 65 poliomyelitis and 134 serous meningitis cases in tissue cultures with trypsin monkey kidneys 65 cytopathogenic virus strains were isolated. In fibroblast cultures from human embryo skin muscle fragments 29 strains could be isolated. Sixty per cent of the stools from poliomyelitis cases were cytopathogenic. Eighty-five per cent of the strains belonged to the poliomyelitis type 1, 13% to type 2. In one case the simultaneous appearance of poliomyelitis viruses of both types was observed. The stools from serous meningitis were found to be cytopathogenic in 19% half were polio type 1, a quarter ECHO type 9, and a quarter other viruses so far not typed. (L. 4)
