TITLE: Hydraulic-system actuating cylinder with two divided working chambers.
Class 62, No. 184140

SOURCE: Izobret prom obraz tov zn, no. 15, 1966, 194

TOPIC TAGS: hydraulic equipment, hydraulic engineering, actuating cylinder

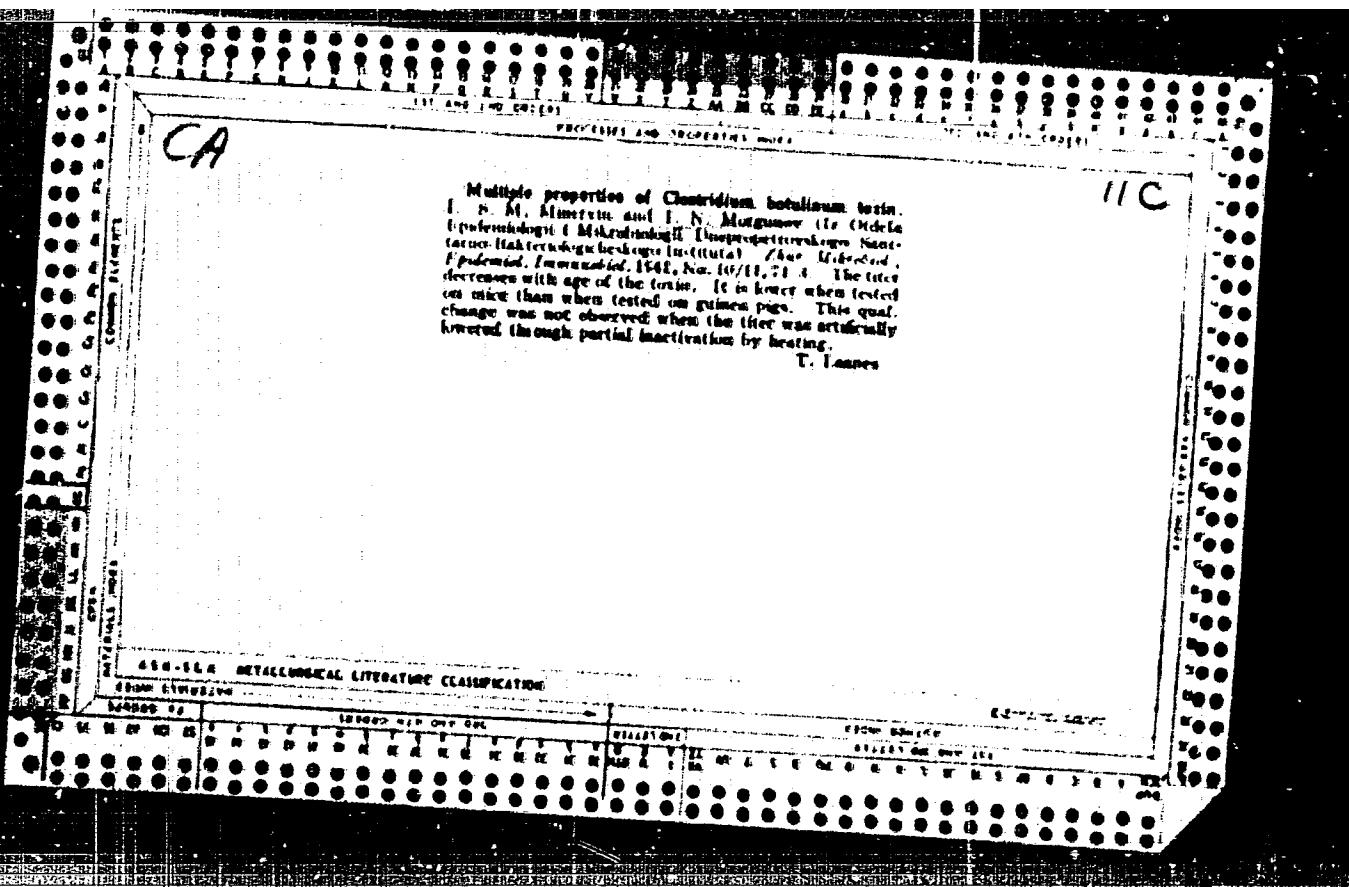

ABSTRACT: An Author Certificate has been issued for a hydraulic-system actuating cylinder with two divided working chambers containing pistons with rods. In order to make it possible to operate on two independent systems and to decrease the cylinder's length, its outer-chamber piston rod consists of two concentric tubes. The rod's inner tube is also the inner working chamber, the piston rod of which is firmly fastened in the body of the outer chamber; in the inner chamber's piston rod are channels for the supply and discharge of the working fluid, and in the outer chamber's piston are drainage channels connected with the atmosphere through a space between the rod's tubes. To simplify the design for operation on one system and to simultaneously increase the force on the rod, the outer-chamber piston rod is made of one duct and in its wall next to the piston is a hole connecting the working chambers.

Title : The action of parenterally administered microcide

Periodical : Zhur. mikrobiol. epid. i immun. 6, 65. Jun 54

Abstract : Parenteral administration of a new antibiotic, microcide, to animals simultaneously experimentally infected with staphylococci results in a decrease in the phagocytic activity of free cellular elements within the animal organism. On the basis of experiments designed to study this phenomenon, it was concluded that the effect of microcide on phagocytic activity was not due only to its action on bacterial cells, but also to an indirect effect on the neuro-humoral regulatory mechanism of the treated animals. TITLE: Experimental Search of a Model for Dysentery Infection. II. Using the Principle of Summation of Stimulation as a Pathogenetic Mechanism for Inducing Dysentery in Cats

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1959 Nr 9, pp 78-85 (USSR)

ABSTRACT: The article describes the efforts of a group of researchers for finding an effective means of reproducing dysentery in cats, to be used as models for study of the disease. In part I of the article the authors had described methods of inducing dysentery in cats. These methods, however, were rather far removed from the normal means of natural infection and somewhat invalidated the cats as experimental models. As N.N. Sirotinin, I.V. Ovsyeyevskaya, Ye.A. Brodakaya and Gromashevskaya had demonstrated, kittens show a greater sensitivity to *Shigella dysenteriae* than adult cats. Here, the morphological lesions to their intestines correspond to those in adult cats, infected after preliminary sensitization. In view of this, the authors attempted to induce dysentery by making use of the mechanism of

Card 1/3

SOV/16-5-L9-17/47

Experimental Search of a Model for Dysentery Infection. II. Using the Principle of Summation of Stimulation as a Pathogenetic Mechanism for Inducing Dysentery in Cats

summation of stimulation with daily per os administration of minimum amounts of *Shigella dysenteriae*. It proved possible to induce dysentery by 4 doses of 1-5 million bacteria, administered per os at intervals of 24 hours. A single sum dose (4-20 million bacteria) failed to induce dysentery. Dysentery is probably induced as follows: the first doses of *Shigella dysenteriae* disintegrate in the body of the cat to form an endotoxin. Intensified by the summation effect, these endotoxins cause pathological lesions of the intestines and this, in turn, provides ready ground for the invasion and multiplication of the *Shigella dysenteriae*, thus leading to the development of the infection proper. It is of interest that the first dose or two of live *Shigella dysenteriae* may safely be replaced by the same dose of vaccine, prepared from the same strain.

TITLE: Mechanism of potentiating toxoid antigen action with a toxin.
Report 1. Specificity of toxin potentiating action

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 4,
1964, 40-45

TOPIC TAGS: potentiation, potentiating mechanism, toxoid antigen
action potentiation, toxin potentiating mechanism, diphtheria toxoid,
diphtheria toxin, staphylococcus toxin, tetanus toxin, tcxin
nonspecific potentiating action

ABSTRACT: Experimental data on various methods of potentiating toxoid
antigen action with sublethal doses of specific and nonspecific toxins
are presented. Immunization with a diphtheria toxoid and a sublethal
dose of diphtheria toxin produces a stronger titer (5AE) than with
diphtheria toxoid by itself (2.1AE). Large doses of staphylococcus
toxin added to a diphtheria toxoid significantly increase diphtheria
toxoid strength, but not so much as the addition of a diphtheria
toxin. Small staphylococcus toxin doses do not potentiate diphtheria

Cord 1/2

ACCESSION NR: AP4031445

toxoid antigenic action. Tetanus toxin also does not display a potentiating effect on diphtheria toxoid. In experiments on guinea pigs, diphtheria toxin (1 DIm per 1 ml toxoid) stimulates antibody formation equally whether introduced together with the toxoid or separately into different extremities. Intravenous injection of toxin appears to inhibit antibody formation. The potentiating phenomenon is nonspecific, with toxin sublethal doses manifesting potentiating effects on non-homologous toxoids as well as homologous toxoids. One of the potentiating mechanisms of toxin appears to be its local toxic effect. Another potentiating mechanism of toxin appears to be stimulation of effector cells of the regional and more remote lymphatic systems and possibly other systems. Orig. art. has: 5 figures.

TITLE: Received signal fluctuations in the antenna of a mobile object in urban ultrashort and meter-waveband mobile radio communication systems

SOURCE: Elektrosvyaz', no. 10, 1966, 56-62

TOPIC TAGS: radio reception, mobile radio, radio signal, random process, signal reception

ABSTRACT: Expressions for amplitude distribution of radio signals received by a vehicle unit in an urban VHF and UHF mobile radio system are obtained on the basis of random process theory. The correlation function and frequency spectrum of the random received signal component are determined by considering reflections from various urban topographical obstructions. The time durations and median frequency of amplitude burst occurrences are found. The frequency spectrum of the random received signal component is narrow in the receiver antenna and is symmetrical around the transmitter frequency; the distribution density at its edges approaches infinity. The mean occurrence frequency of

O

graphite reactors of the channel type, such as are used in the Beloyarsk atomic electric station, with nuclear superheating of the steam. The rating has been increased to 200 MW by changing over from two-loop to single-loop operation and by modifying the working channels. The use of trans-critical parameters will improve the heat transfer and hydrodynamics of the coolant flow and, together with the use of single-pass construction will make ratings of 800--1000 MW possible. Burnup rates of 40--45 thousand MW-day are projected with 5% enrichment. Other topics discussed are possible interchangeability of fuel elements, optimal fuel element construction, optimal channel arrangement, and possible improvements in the neutron balance and distribution. Orig. art. has 8 figures and 3 tables.

TITLE: Pulse graphite reactor IGR

SOURCE: Atomnaya energiya, v. 17, no. 6, 1964, 463-474

TOPIC TAGS: pulse graphite reactor, high neutron flux pulse, nuclear reactor

ABSTRACT: The paper is a summary of the SSSR f322a report at the International Conference on Peaceful Uses of Atomic Energy in Geneva, 1964. It represents an elaboration of the description of the pulse graphite reactor IGR given by S. M. Feinberg at the Second International Conference. The pulse reactors are used when a high neutron flux is desirable. The described reactor was in opera-

Title : Effect of the Depth of Plowing on the Winter Rye Crop on
Medium Grade Polder Soil.

Orig Pub : Znalezliye, 1956, No 11, 117-119

Abstract : The experiment was performed in 1954 at the developmental test station of Kalingradskaya Oblast' on light podzolic sandy-argillaceous polder soil. On the shallow plowed lot (mold-boradless shallow plowing from 10 to 12 cm), the plant growth and the activity of its soil microflora started earlier than on the lot with deep plowing (32-35 cm); with one and the same norm of sowing, there was only half the amount of plants over 1 m² after deep plowing. On the lot with shallow plowing the yield of winter rye was 28.3 centners, and with deep plowing 19.7 centners per hectare. In soils that are temporarily excessively wet, shallow plowing shows better results for winter crops than deep plowing.

TITLE: Taking into account nonuniformity of the gas supply in the hydraulic design of a gas main

SOURCE: Kuybyshev, Aviatsionnyy institut. Trudy, no. 15, pt. 2, 1963. Doklady kustovoy nauchno-tehnicheskoy konferentsii po voprosam makhaniiki zhidkosti i gaza (Reports of the Joint scientific-technical conference on problems of the mechanics of liquid and gas), 275-282

TOPIC TAGS: gas engineering, hydraulic resistance, pipeline

ABSTRACT: The article starts with a review of important work in the field done in the Soviet Union and abroad. The experimental investigation was done on a high pressure gas main in Kuybyshev; the gas main, used to supply purified natural gas, was long and of large diameter. It was provided with sampling points at which observations were made every 15 minutes for a period of three days. A figure shows the pressure at the beginning and end of the gas main as a function of time. As a result of the experiments it was found that unsteady state flow has a considerable effect on the resistance of the gas main, and

Card 1/2

L 15717-66

ACC NM: AT6003097

must be taken into account in design and installation. A method based on the gasodynamic theory of modelling permits tests to be carried out on short sections of gas main. In design, to determine the diameter of the gas main, the average integral value of the flow should be used; this can be obtained from a typical daily chart. Choice of the resistance coefficient must be made on the basis of existing experimental data. Orig. art. has: 3 formulas, 3 figures, and 1 table.

Novyye vozmozhnosti meteorologicheskogo primeneniya radiolokatsii (New possibilities for meteorological use of radar), 106-111

TOPIC TAGS: radar, meteorological radar, meteorology, radar echo, cloud, precipitation

ABSTRACT: Polarization methods for analysis of echoes from clouds and precipitation have been developed recently. This article describes a radar apparatus which can be used to investigate the polarization characteristics of echoes from clouds and precipitation. The Laboratoriya radiolokatsii Tsentral'noy aerologicheskoy observatoriya (Radar Laboratory of the Central Aerological Observatory) has developed a two-antenna radar set with a fixed beam and variable polarization of the signal. The system can transmit and receive echoes with linear, circular, or elliptical polarization. The block diagram of the set is shown in Fig. 1 of the Enclosure. The outfit is based on a modern 3-cm high-potential radar set. The
Card 1 1/3

ACCESSION NR: AT4036017

outfit has two identical three-meter antennas directed toward the zenith. One antenna is used for transmission and reception of the signal and the other for reception only. The signals from both antennas are fed through the antenna switch and attenuator to the input of a common receiver and then to a recorder. A special polarization converter was used which consists of a quarter-wave grid made up of metal plates set in foam plastic. The errors in relative measurements of the intensity levels of the echoes, caused primarily by error of the attenuator and error in averaging of the fluctuating signal, usually do not exceed ± 1.5 db. It is possible to measure almost simultaneously all four parameters of elliptical polarization associated with the microstructure of a meteorological object: ellipticity, degree of polarization, inclination of the ellipse, and direction of rotation of the electric vector. Among the shortcomings of the ellipse, and direction of only vertical soundings are possible. Orig. art. has: 1 formula and 3 figures.

TITLE: Radar apparatus for polarization investigations of clouds and precipitations

CITED SOURCE: Tr. Tsentr. aerol. observ., vyyp. 48, 1963, 106-111

TOPIC TAGS: weather radar, echo-signals, polarizing converter, 3-cm radar meteorological objects

TRANSLATION: The apparatus is built on the base of a high-potential 3-cm radar set. It has two zenith-pointing identical 3-cm antennas. One antenna is used for transmitting and receiving the signal, the other for reception only. Echo-signals from both antennas are fed into the input of the common receiver through a change-over switch and an attenuator and then to the recording device. Conversion of polarization is done in the first transceiving channel. The polarizing converter is made in the form of a quarter-wave array consisting of metallic plates mounted on foam plastic. The array is located near the radiating horn and travels in the direction of rotation. The action of such a converter is analogous to the action of a quarter-wave optical plate. The apparatus makes it possible to analyze echo-

TITLE: Estimating the effectiveness of artificial influences on clouds on the basis of the polarization characteristics of the echo-signal

SOURCE: Tsentral'naya aerologicheskaya observatoriya. Trudy, no. 57, 1964. Radiolokatsionnye metody aerologicheskikh nabлюдений (Radar methods of aerological observation), 49-54

TOPIC/TAGS: weather control, cloud seeding, hail prevention, meteorological electronics, echo polarization, meteorological radar, crystallization zone, weather balloon

ABSTRACT: During the 1961-1962 expedition to the Samsar Valley, a beginning was made on research work aimed at employing radar techniques to estimate the effectiveness of artificial influences on clouds for the purpose of averting hail. It is important, during such tests, to have some notion of the internal evolution of the cloud and its physical restructuring during the period of the artificial effect. The importance of the zone of crystallization which lies at the very basis of the physics of methods designed to influence clouds artificially

Card 1/4

142947-65

ACCESSION NR: A15008980

is pointed out, and the point is made that it would be of great value, from the point of view of estimating effectiveness, to consider the feasibility of employing radar techniques for the detection of this crystallization zone and for the study of its development and propagation. It is impossible to obtain information on the phase state of the particles in a cloud directly according to the magnitude of the echo signal alone. This is explained in the article. On the other hand, a valid estimation of the phase state of the particles which form the echo-signal at the time of crystallization can be made by means of polarization methods. This is done in the article. The use of this method as one of the criteria in estimating the effectiveness of cloud seeding measures is considered in this article. A brief outline is given of the method as applied to a station with a single mobile antenna. These polarization methods are based essentially on the depolarization phenomena which occurs when radiowaves of selected polarization are scattered by the non-spherical particles of the atmosphere. In the case considered in this paper, the HF section of the radar oscillation was modified in order that the set might periodically radiate and receive radiowaves of different polarization. In the AWS-3 radar this was accomplished by placing a rotating quarter-wave grid array before the radiating

L 4947-65

ACCESSION NR: AT5008980

plement. During the actual operational conditions under which the Samsar expeditions functioned, a series of polarization measurements was made from a ~~scare~~ ~~empty~~ ~~filled~~ balloons to altitudes of several hundred feet). The present article deals only with problems of polarization measurements; a more detailed program of the work undertaken during the expedition, among them the results of radar observations, are closely analyzed in another article appearing in the same collection of which this paper is a part. The experiments aimed at artificially producing charges in cloud formations by means of surface rocket installations filled with solid carbon dioxide were conducted on 3, 13, and 31 August of 1961 in the region of the Expedition. A certain number of the experiments were also conducted by releasing various reagents from an aircraft. In addition, on days when no artificial influences were employed, the polarization characteristics of the cloud systems were also studied as the latter developed naturally. Some results of the measurements of polarization characteristics carried out on days when artificial effects were tested are discussed in this article. From an analysis of the material contained in this paper it is clear that the polarization method enables one to record the phase transformations in the clouds which are caused by the artificial effect, i.e., discharge, and in so doing to

1. 12947-65

AUTHOR: Morgunov, V.K.

TITLE: A new device for the study of kinematics of moving objects

PERIODICAL: Akademiya nauk SSSR, Sibirskoye otdeleniye. Izvestiya, no. 12, 1961, 30-36

TEXT: The author describes the operation and use of a camera for photographing moving objects, (Author's Certificate no. 127574 of 17th June 1959). The device permits the recording on one large size negative, of a sequence of a moving object, photographed at equal, predetermined, intervals of time. The device is stated to have several advantages over a cine-camera: The use of a tele-lens and consequently larger picture dimensions, and an increase in the accuracy of measurements, with all other conditions being the same. It is possible to determine the trajectory of the object and to calibrate the picture displacement directly into distances between the consecutive positions of the object; this also considerably increases the accuracy and facilitates the subsequent picture processing. The use

Card 1/p 4

32671

S/200/61/000/012/001/002
B201/B301

A new device for the ...

of glass negative prevents shrinkage. The device is illustrated in Fig. 1. The objective 2 is on the front 1 of a fixed camera and has a central shutter 3. In operation the shutter opens automatically at equal intervals of time to give equal exposures. The shutter is operated by a spring mechanism 4 through a cam 5. A lightproof elastic screen 7 with a vertical slot 8 is fixed directly in front of the emulsion plate 6. The slot may be moved along the plate by turning the handle 9 at an external panel 10, connected by a Bowden shaft 11, conical pinions 12 and vertical reels 13 to screen 7. A sighting device on the top of the apparatus consists of a sighting frame 14 and a moving sight 15. The displacement of the sight is coupled to the displacement of the slot 8 by means of an elastic tape 16, wound on reel 17, which has the same diameter as the reels 13. This arrangement secures the coincidence of the sight axis with that of the slot. For synchronization purposes a time marker, consisting of an electric bulb 18 in its casing 19, is incorporated. When at a required instant the button 20 is pressed, a light spot, equal to the slot width, is impressed on the film. The task of the operator consists of moving the

Card 2 of 4

A new device for the ...

sight 15 by means of a handle 9 and keeping the moving object in the field of view of the front sighting frame 14. Thus the picture of the object at the plate remains within the dimensions of slot 8. The slot width is determined from the formula $d = \frac{v \cdot F \cdot n}{l \cdot w}$, where d - the slot

width in mm, v - the minimum expected speed of motion of the photographed object (m/sec) F - focal length of the objective (mm), l - distance to the object (m), w - frequency of photographs (exposures per sec), n - the maximum allowed number of exposures for the same spot of the photo-emulsion. The value of n is 5-7 with dark background and a light object and 2-3 with a light background and a dark object. The speed of the object is given by the formula $v_t = \frac{\Delta x \cdot l}{\Delta t \cdot F}$, where v_t - speed of the ob-

ject at any instant (m/sec), Δx - distance between the consecutive images on the plate (mm), Δt - intervals at which exposures are made (sec), l - distance to the object along the optical axis (m), F - focal length (mm). A model of the above apparatus has been built at the Laboratory of Ice-Thermionics of the Transportation and Energetics Institute of the Siberian

Branch AS USSR, with $F = 300 \text{ mm}$ and $18 \times 24 \text{ cm}$ plates. The apparatus was used successfully for determining the dynamic pressure of ice on bridge structures by means of the kinematic method developed by K.N. Korzhavin (Refs. 1 and 2: Tr. TEI ZSFAN SSSR no. 7, Novosibirsk 1958). The apparatus was also successfully used in several cases on the Siberian rivers and in observations of the ice movement in the region of the Bratskaya Geophysical Station [Abstracter's note: Under Construction]. There are 3 figures and 4 Soviet-bloc references.

MORGUNOV, V.P.; gornyy inzh.; RYSH, B.H., gornyy inzh.; LAGUTA, N.K.,
gornyy inzh.

Mine schools for the exchange of advanced practices. Ugol' Ukr.
4 no.9:44-46 8 '60. (MIRA 13:10)
(Mining engineering--Study and teaching)

MORGUNOV, V.P.; MORDOVSKIKH, V.P., ref.; KOLBICHEN, V.I., tekhn. red.

[Chelyabinsk Province in the period from the 21st to the 22d
Congress of the CPSU; facts and figures] Cheliabinskaia oblast'
ot XII k XIII s"ezdu KPSS; tsifry i fakty. Cheliabinsk, Che-
liabinskoe knishnoe izd-vo, 1961. 752 p. (MIRA 15:12)
(Chelyabinsk Province—Economic conditions)

BALASHOV, V.H.; MORGUNOV, V.S.

Gamma-quantum analysis for heavy elements. Biul.nauch.-tekhn.
inform.VIMS no.1:70 '60. (MIRA 15:5)

I. Sredneaziatskiy nauchno-issledovatel'skiy institut geologii i
mineral'nogo syr'ya, Tashkent.

(Gamma rays—Industrial applications)
(Ores—Sampling and estimation)

MORGUNOV, V.S.; MAZANOV, V.F.

Possibility of using the SRP-2 radiometer to record integral and
"stable" components of a spectrum of gamma-ray scattering. "Uch. zap."
SAIGIMSA no. 7:171-174 '62.

Field boron detector. Ibid. 275-276 (MIR 17:2)

I. Sredneaziatskiy nauchno-issledovatel'skiy institut geologii i mineral'-
nogo syr'ya, Tashkent.

MAMOKHIN, I.I., MORGUNOV, V.S., POLYAKOV, A.K., RUDENKO, Yu.P.

Using the gamma-ray scattering method in Karamazar complex ore
mines. Uch. zap. SAIGIMSa no.8:63-71 '62. (MIRA 17:1)

I. ATRU i Sredneasiatskiy nauchno-issledovatel'skiy institut
geologii i mineral'nogo syr'ya, Tashkent.

MORQUNOV, Yu.G.; SLAVIN, V.I.

Permian sediments of North Ossetia. Dokl. AN SSSR 169 no.2:392-394
Mr '63. (MIRA 16e3)

L. Moskovskiy gosudarstvennyy universitet im. M.V. Lomonosova.
Predstavleno akademikom N.M. Strakhovym.
(Ossetia, North--Sediments (Geology))

MORGUNOV, Yu.G.

Middle Paleozoic formations of North Ossetia. Vest. Mosk. un.
Ser. 4: Geol. 20 no.4:55-62 Jl-Ag '65. (MIFI 18:9)

1. Kafedra dinamicheskoy geologii Moskovskogo universiteta.
