The effect of sulphiding ...

with orientation around grains. The bushes were cut into rollers and turned in order to test them on friction, wear and running-in qualities. The anti-scuffing properties were determined by checking wear without lubrication. The graph of results indicates no reduction of wear due to sulphiding, when measurements were made with a passameter. Finally, tests were made for machinability determination, with simultaneous measurement of wear, by the method of Professor M. M. Krushchov. The results are tabulated, and they reveal that the sulphided components are run-in faster than the non-sulphided workpieces. The former also exhibit lower friction force and operate more steadily. The table demonstrates that the sulphur additive promotes greater wear which is contrary to previous investigations. Sulphiding may be recommended in cases where the main requirement is anti-scuffing property and not the wear resistance. There are 2 figures, 4 tables and 8 references: 7 Soviet-bloc and 1 non-Soviet-bloc. The reference to the English-language publication reads as follows: F. D. Waterfall, Reducing scuffing and wear of ferrous metals, Surface treatment by sulfidizing process. Engineering no. 4846, 1959, 197.

TITLE: Reducing the heat treatment cycle for aluminum alloys AL9 (AL9)
and AL9 B (AL9V)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Tsvetnaya metallurgiya,
no. 5, 1962, 132 - 136

TEXT: The central laboratory of the "Tashsel'mash" Plant investigated in cooperation with the Tashkent Polytechnic Institute the possibility of reducing the heat treatment time of small AL9 and AL9V parts. The parts were quenched under various conditions and during 0.5, 1, 2, 4, 6, 8 and 12 hours. An electric shaft furnace with forced circulation of the air was used. The preheating temperature for quenching was $535+5^{\circ}\text{C}$. The mechanical properties of the alloys were tested on specimens recommended by GOST 2685-53. The surface roughness of raw and heat-treated specimens was determined with the use of a P 18 (R18) steel cutter, at 100 m/min cutting speed, 0.07 mm/rev feed rate, and 0.4 mm cutting depth. As a result of the investigation the following heat treatment conditions

Card 1/2

S/149/62/000/005/006/008

A006/A101

Reducing the heat treatment cycle for...

are recommended for small Al9 and Al9V parts: heating temperature for quenching, $535 \pm 5^\circ\text{C}$; holding time of the parts after the quenching temperature had been attained, 30 min. These conditions assure the following mechanical properties: for alloy Al9 after heat treatment "T4" (according to GOST 2685-53) $\sigma_{b2} \geq 18 \text{ kg/mm}^2$; $\zeta \leq 4\%$ and $H_B \leq 50 \text{ kg/mm}^2$. For alloy Al9V $\sigma_b \geq 16 \text{ kg/mm}^2$; $\delta \geq 1\%$ and $H_B \geq 50 \text{ kg/mm}^2$. Parts thus heat-treated proved to be satisfactory in operation on cotton-cutting machines. There are 3 tables and 6 figures.

PERIODICAL: Izv. AN UzbSSR, ser tekhn n., 1957, Nr 1, pp 91-102

ABSTRACT: The article describes in brief water intakes not equipped with any dam and those equipped with a diversion dam used for irrigation canals in Central Asia. General ideas are presented with regard to the principles of the composition of water-intake and dam configurations and with regard to problems of changes in river beds due to the dams built on them. The formula on p 98 contains a misprint.

In the World of Books and Periodicals (V mire knig i
zhurnalov) "Fan va turmush" ("fan va turmush")

PUBLISHER:

Tekhnika molodezhi, 1958, Nr 12, pp 10-18 (U.S.A.)

ARTICLE:

In this article, the periodical "Fan va turmush" appearing since 1957 is submitted to a short criticism. This popular-scientific magazine (scientific magazine for the general public) is the organ of the Academy of Sciences of the Uzbekskaya SSR. As "Fan va turmush" is the first periodical to appear in Uzbek, its edition was an important cultural event. It informs a great circle of readers in the country and in towns about the latest achievements in the various fields of science and engineering in the USSR, in the Uzbekskaya SSR, and abroad. It extends the field of view and promotes civilization of the whole people. Among other things, the magazine published articles by Said Shermukhammedov, a young scientific collaborator at the Institut filosofii i prava AN UzSSR (Institute of Philosophy and Laws of the Uzbekskaya SSR), by A. I. Mal'tsev, Member, Academy of Sciences,

Card 1/2

in the world of Books and Periodicals. "Fan va turmush" (V/29-59-12-12/2)
Uzbekskaya SSR, by I. Gulyamov, Candidate of Historical Sciences,
by V. S. Starodubtsev, member, Academy of Sciences, etc.,
Vice-president of the Uzbekskaya SSR, and by many other
authors. In 1958 the volume of the periodical was increased
from 32 to 40 pages. In 1959 letters show, "Fan va
turmush" enjoys wide popularity.

TITLE: Specific epidemiological and epizootiological features of brucellosis in Uzbekistan. Report I

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 2, 1965, 61-65

TOPIC TAGS: Br. melitensis, brucellosis, Uzbekistan, epidemiology, epizootiology, milk

ABSTRACT: The specific epidemiological feature of present day brucellosis in Uzbekistan is the reduced incidence in agricultural workers and the rising incidence in the rest of the population, especially in the cities. The specific epizootiological feature is the increasing number of cattle stricken with brucellosis and the reduced number of goats affected by the disease. Milk and milk products from diseased cattle have been found largely responsible for the increasing number of brucellosis cases in the human population. A revision of the sanitary and veterinary regulations is recommended

Card 1/2

L 42432-65

ACCESSION NR: AP5007993

for farms where cattle brucellosis is bacteriologically proven to be caused by the migration of Br. melitensis. With reservoir expansion of epidemic brucellosis causative agents, factors promoting the migration of Br. melitensis to cattle should be investigated. The properties of brucella parasitic in cattle which actually are not the primary hosts of this species should also be investigated. Orig. art. has: 1 table.

TITLE: Epidemiological role of cattle for slaughter in occupational
brucellosis development at the Tashkent Meat Packing Plant

SOURCE: Meditsinskiy zhurnal Uzbekistana, no. 4, 1965, 8-9

TOPIC TAGS: brucellosis, epidemiology, food processing, industrial
hygiene

ABSTRACT: The present study was prompted by the high incidence of
brucellosis over many years among workers of the Tashkent Meat
Packing Plant, including office workers, electromechanical workers,
and others. From 1958 to 1962, 14.5% of all absenteeism due to
illness at the plant was caused by brucellosis. Bacteriological
investigations of blood and bone marrow of workers from 1958 to 1962
disclosed 50 brucella cultures, that is, in 35% of all workers. This
group included fresh and chronic forms of brucellosis and all cultures
were identified as Br. melitensis. In studying the clinical course of

Card 1/2

L 63087-65

ACCESSION NR: AP5015072

the disease, it was noted that in most cases the incubation period did not coincide with the time that the known brucellosis infected animals were slaughtered. This circumstance focused attention on the incoming certified "healthy" cattle. Special serological and bacteriological investigations of all "healthy" cattle were conducted, and some of the certified "healthy" animals were found to be infected with brucellosis. Such cases undoubtedly contribute to the high incidence of brucellosis because the necessary precautions during slaughtering and meat processing are not exercised. Veterinary personnel are strongly advised to inspect cattle more carefully before certification, and plant supervisory personnel are urged to enforce personal hygiene and industrial hygiene regulations more effectively. Orig. art. has: 1 table.

SOURCE: Zhurnal mikrobiologii, epidemiologii i imunobiologii, no. 11, 1965, 6-9

TOPIC TAGS: brucellosis, bacteria, bacteriology

ABSTRACT: Study of Brucella cultures isolated from cattle, sheep, and goats and from humans showed that 100 out of 161 were typical representatives of Br. melitensis (62.1%) while 31 were typical Br. abortus (19.1%). Atypical properties were noted in 19 cultures of Br. melitensis (11.1%) while 11 cultures were typed Br. abortus (6.7%). The Br. melitensis strains isolated from the sheep and goats were generally typical representatives of this species of Brucella. Of the cultures isolated from cattle, 14.6% of the Br. melitensis strains and 13.4% of the Br. abortus strains were atypical. Among the Br. melitensis cultures isolated from sick people, 11.2% were atypical. These were obtained from individuals handling cattle on farms where brucellosis was prevalent. TITLE: The effect of the combined action of radioactive iodine-131 and noise on cardiac activity

SOURCE: Byulleten' eksperimental'noy biologii i meditsiny, v. 59, no. 2, 1965,
43-45

TOPIC TAGS: radioactive element, iodine, noise, cardiodynamics, cardiovascular system

ABSTRACT: A study was made of the effect on cardiac activity of I¹³¹, noise, and the combined action of these two factors in male dogs weighing 10-15 kg. Prolonged administration of I¹³¹ in a dose of 4 to 5 μ curies/kg caused a change in the EKG waves and intervals (deceleration of cardiac contractions, increase in the PQ and QT intervals and in the P wave, shifting of the ST intervals to below the isoelectric line), especially distinct in functional loading. Noise (100-105 db) caused moderate EKG changes (deceleration of cardiac contractions, reduction of the PQ and QT intervals and also of the P wave). The combined action of these factors produced the same changes as with iodine-131 alone (deceleration of cardiac contraction, an

Card 1/2

L 39692-65

ACCESSION NR: AP5006685

increase in the PQ and QT intervals, reduction of the P wave, an increase of the R wave, shifting of the ST to below the isoelectric line, appearance of a biphasic negative T wave). However, these changes set in earlier and were more pronounced under the combined action.

TITLE: Profile of the absorption and dispersion curves of the R-lines in ruby 15

SOURCE: AN SSSR: Doklady*, v. 158, no. 2, 1964, 317-320

TOPIC TAGS: absorption, ruby crystal, dispersion, Lorentz line profile, Gauss line profile, oscillator strength, polarization interference method

ABSTRACT: This experimental investigation was undertaken in order to determine whether the absorption and dispersion curves of the ruby R-lines have the Lorentz or the Gauss profile. The absorption spectra were obtained at room temperature. The ordinary and extraordinary rays were photographed separately with the DFS-3 spectrograph. The dispersion was measured with the same specimen by the polarization interference method described previously (N. K. Bel'skiy, DAN 143, #6, 1313 (1962)). The results indicate that the Lorentz curve fits well the experimental data. The oscillator strengths for R_1 and R_2

TITLE: Determination of the oscillator strength of the R₁ line of ruby at 78 K by the Rozhdestvenskiy hook method

SOURCE: AN SSSR. Doklady, v. 162, no. 3, 1965, 527-529

TOPIC TAGS: ruby laser, ruby laser line, oscillator strength, temperature effect

ABSTRACT: This is a continuation of earlier work (DAN v. 158, No. 2, 217, 1964) in which the oscillator strength of the R₁ line of ruby was obtained at room temperature. The present article describes measurements of the oscillator strength at liquid-nitrogen temperature. The feasibility of applying the Rozhdestvenskiy hook method to this problem is first discussed briefly. The usual optical scheme for obtaining the hooks was modified to adapt it to the investigation of narrow polarized lines in crystals. The Rozhdestvenskiy interferometer was replaced by a polarization interferometer described by one

Card 1/3

ACCESSION NR: AP5014845

15

of the authors (Bel'skiy, DAN v. 143, No. 6, 1313, 1962). Ruby crystals with Cr³⁺ concentrations 0.098 and 0.044 per cent and of length 24.04 mm were investigated. The oscillator strengths calculated for both concentrations were equal at 1.5×10^{-6} the error being 6 per cent for the 0.098 per cent Cr³⁺ and 7 per cent for the 0.044 per cent Cr³⁺. It is therefore concluded that the oscillator strength of the ruby R₁ line does not change when the temperature goes from room to 78K. The authors thank I. V. Obreimov and B. L. Lifshits for continuous interest in the work and useful hints. The authors thank also S. V. Grum-Grzhimaylo for measuring the concentration of the Cr³⁺ ions in the ruby samples. This report was presented by I. V. Obreimov. Orig. art. has: 2 figures and 3 formulas.

Title : Condensation reaction of camphenilane aldehyde with ketones and esters

Periodical : Izv. AN SSSR. Otd. khim. nauk 5, 820-828, Sep-Oct 1953

Abstract : The condensation reaction of camphenilane aldehyde with acetone, methyl-ethylketone, acetophenone, mesityl oxide and methylheptenone, was investigated. The condensation products, their physico-chemical properties, are described. The characteristics of unsaturated esters, derived from condensation of camphenilane aldehydes with ethyl acetate and ethyl acetoacetate, are listed. Periodical : Izv. Akad. Nauk. SSSR, Otd. Khim. Nauk., 1954, 1954, No. 5, May - June 1954

Abstract : The reaction between camphene oxide with primary alcohols (ethyl, n-butyl, isobutyl, n-octyl) and secondary alcohol (isopropyl) was investigated in the presence of sulfuric acid. The derivation of acetals of camphenilane aldehyde obtained as result of reaction between camphene oxides and primary alcohols and consequent isomerization of the oxide, is described. Data are also given on the products derived from the reaction between camphene oxides and secondary alcohols. One USSR reference. Tables.

hydrocarbons was determined by combustion over copper oxide or over a platinum spiral. If H₂S was present in the gas a separate determination of it was carried out by passing a separate sample of the gas through a titrated solution of iodine, with subsequent titration of the free iodine. For a detailed study of the hydrocarbon composition of the gases a fractionation of the gases was carried out at a low temperature in the semi-automatic TSIATIM-51 apparatus. As a result of the fractionation were isolated CH₄, C₂H₆, C₃H₈, h- and iso-butane,

total isomers of pentane, and higher hydrocarbons as a residue. Since methane was driven off together with the non-combustible gases (N_2 and other), and also in admixture with the air contained in the sample, the amount of methane was determined by combustion over a platinum spiral. In the butane fraction a determination was made of the content of n-butane and iso-butane, on the basis of the temperature of dissolution of this mixture in O-nitrotoluene. The investigations showed that regardless of the

TITLE: Investigation of Hydrocarbons of Naphthalene Series in the Kerosene Fraction of oil from the Romashkinskoye Oil Field in the Minnibayevskaya Area. (Issledovaniye uglevodorodov ryada naftalina v kerosinovoy fraktsii nefti Romashkinskogo mestorozhdeniya Minnibayevskoy ploshchadi)

PERIODICAL: Khimiya i Tekhnologiya Topliv i Masel, 1953, Nr 9,
pp 18 - 24, (USSR)

ABSTRACT: The kerosene fractions of Devonian Tartar petrol contain considerable quantities of aromatic hydrocarbons. Investigations were carried out with the aid of the pi-crate method and ultra-violet spectra of condensed hydrocarbons of the kerosene fraction (200° - 320°C) of Romashkino petroleum. This fraction was separated by chromatography on silica gel ASM (50 - 100 mesh) into a naphthenic-paraffinic fraction and aromatic concentrate. The latter was divided into monocyclic and dicyclic compounds. The sulphur-containing compounds were separated by oxidising the aromatic concentrate with hydrogen peroxide in a medium of glacial acetic acid and the oxidised sulphur-containing compounds adsorbed on silica gel ASK. The desulphurised aromatic hydrocarbons were vacuum

distilled into three - five-grade fractions in a 37-plate column. Each fraction was treated with picric acid and the naphthalene hydrocarbons were separated. The homologues of naphthalene were separated by rectification, and in some cases the isomers were also split off. The liquid isomers were separated by repeated recrystallization from ethyl or methyl alcohol and subjected to further decomposition. The crystalline hydrocarbons were purified by repeated recrystallization from methyl alcohol. The separated hydrocarbons were identified by elementary analysis and by comparing the physical constants and melting points of secondary picrates with literature data. The individual naphthalene hydrocarbons, as well as mixtures of isomers, were further subjected to spectral analysis of the near ultra-violet region (2,900 - 3,300 Å). The absorption spectra were measured on the spectrophotometer SF-4 (in n-pentane solution) (Fig. on page 19). Constants of the separated hydrocarbons are given in a table (pages 20 and 21). The separated hydrocarbons consisted of naphthalene, β -methylnaphthalene,

ABSTRACT: This work is devoted to the study of tetralin series hydrocarbons and is a continuation of the investigation of aromatic hydrocarbons of kerosene fraction obtained from petroleum of Romashkinsk deposit. Chromatography, rectification, catalytic dehydrogenation, picrate method, and spectral analysis were employed in the study. The results are shown in Table "A".

1907. CHANGES IN THE ELECTROENCEPHALOGRAM OF MAN IN THE PROCESS OF FORMING A MOTOR HABIT (Russian text) - Sakhulina G. T and Mukhamedova E. A. Moscow - ZH. VYSSH. NERV. DEYAT. 1958, 8/4 (491-498) Graphs 6

EEGs of healthy adult subjects were recorded during muscular activity (pedalling on a bicycle ergometer). The initial phases of this kind of muscular work, new to the subject, are accompanied by the appearance in the EEG of high frequency oscillations recorded from wide regions of the cerebral cortex, but most distinctly from the sensomotor zone. As this kind of movements is being trained, high-frequency oscillations, localized in separate points of the sensomotor region, appear in volleys in the same rhythm as the movements, alternating with α -waves. Later, when the subject gets accustomed to the muscular work, α -waves are recorded in all the examined regions of the cortex (occipital, parietal, frontal). (II, 8*)

TITLE: Problems in the epizootiology and diagnosis of Rabies

SOURCE: Veterinariya, no. 10, 1966, 30-33

TOPIC TAGS: animal disease, infective disease, rabies, precipitation reaction, diagnostic medicine, veterinary medicine

ABSTRACT: Rabies may be diagnosed rapidly using the precipitation reaction, and preventive measures may therefore be undertaken in minimal time. As rabies antigen does not appear in equal quantities in all parts of the brain, it is necessary to take samples from all of them; study of the spinal cord is particularly necessary. In the Gur'yev and some other oblasts of Kazakhstan, Babes-Negri bodies are found infrequently. Study of histological sections also increases diagnostic accuracy, though care must be taken not to mistake other inclusions for Babes-Negri bodies.

The seasonality of rabies (beginning in December, with highest incidence in January—April) in the Gur'yev oblast is of epizootiological interest. It is suggested that prophylactic and preventive measures be undertaken in the fall. A table shows the results of the authors' investigation using a diagnostic complex including examination for Babes-Negri bodies, precipitation reaction, and bioassay. [WA-50; VCBE No. 12]

TITLE: Theory of lunar craters

SOURCE: Kosmicheskiye issledovaniya, v. 4, no. 3, 1966, 408-413

TOPIC TAGS: lunar crater, selenology, lunar landform, ring formation, moon surface, meteorite impact

ABSTRACT: Questions dealing with the expenditure of energy in the formation of craters as the result of meteorite impact are discussed. Specifically, the theory of "explosive diffusion" is advanced to account for the characteristic structure of lunar craters having concentrically enclosed walls (Vitello, Posidonius, Riccioli, Furnerius, Wargentin, Gassendi, Marth, etc.). According to this theory, secondary and even subsequent craters may be formed when the material ejected from the first impact itself strikes the ground. It is further established that each successive impact in the process of "explosive diffusion" is characterized by a lessening of intensity. Orig. art. has: 33 formulas. [DM]
